

Lymph nodes and vessels

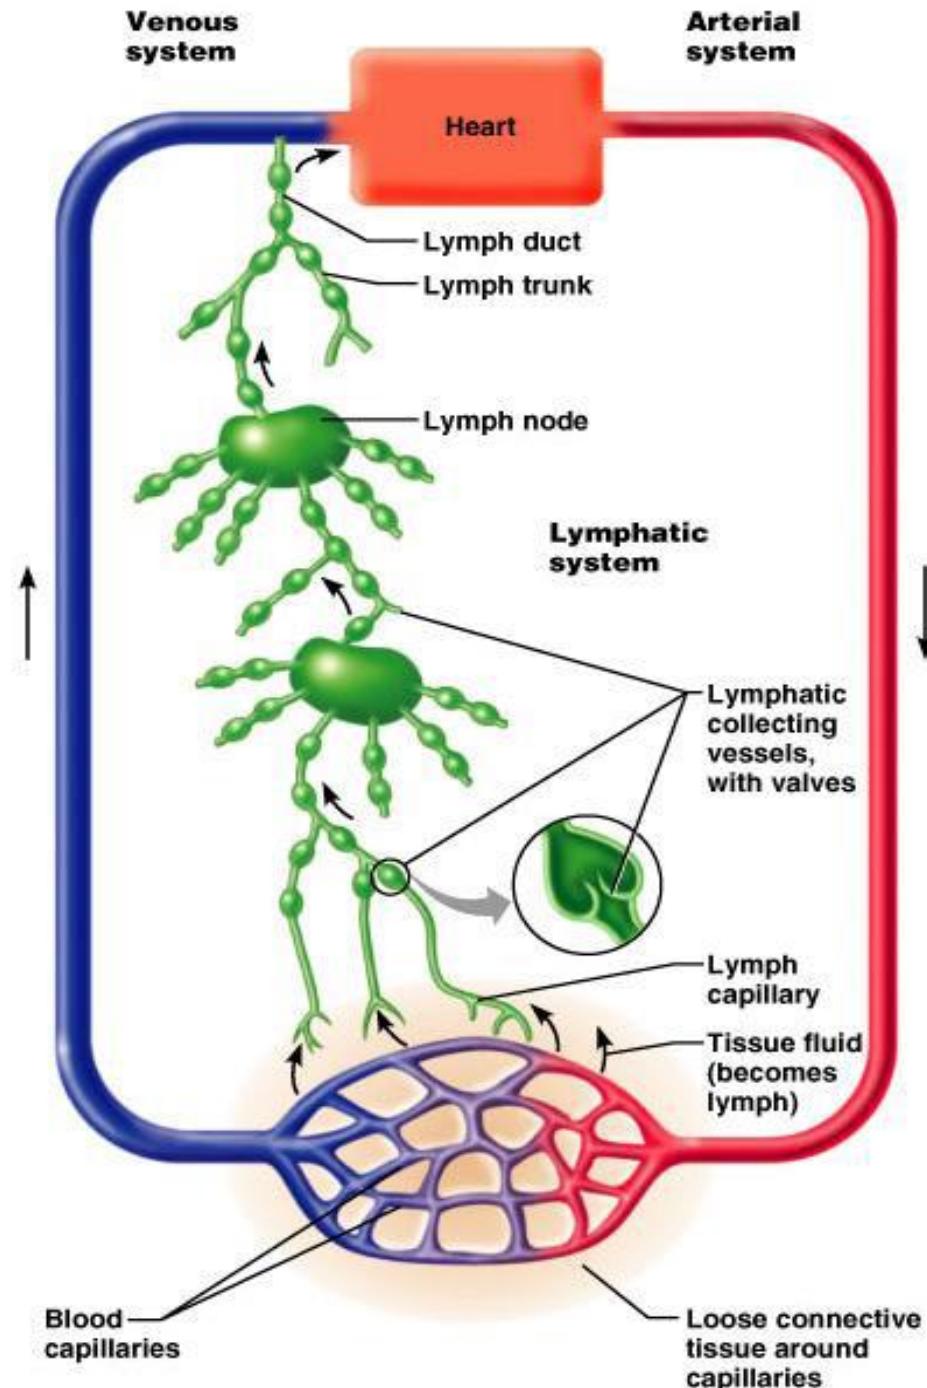

David Kachlík
Martin Špaček
Anne LeRoy

Lymph system

- **lymph (lympa)**
 - composition similar to plasma with low protein content
 - chylus (*chylos* = gr. juice) – intestinal lymph, milky (due to *chylomicrones*)
- **lymph vessel**
(*vas lymphoideum*)
- **lymph organs**
- all lymph is drained into veins
(into angulus venosus)
- missing in some organs
(cartilage, cornea, bone marrow, placenta) or replaced with other fluid
(brain, eyeball, inner ear...)

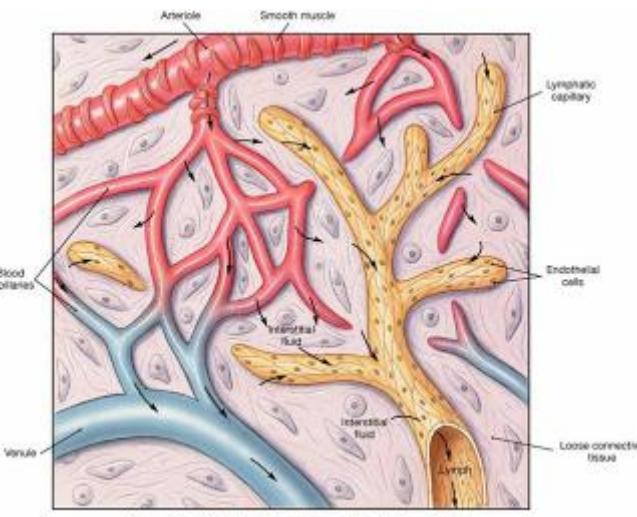

Lymph system – function

- blood filtration and „purification“ via lymph nodes
– immune function
- return of extravascular fluid into blood circulation
- transport of proteins and other large particles
into systemic circulation
- „education“ (maturation) and multiplication of
lymphocytes
- transport of lipids in chylomicrones from small
intestine into systemic circulation
- daily production = about 60 ml / kg

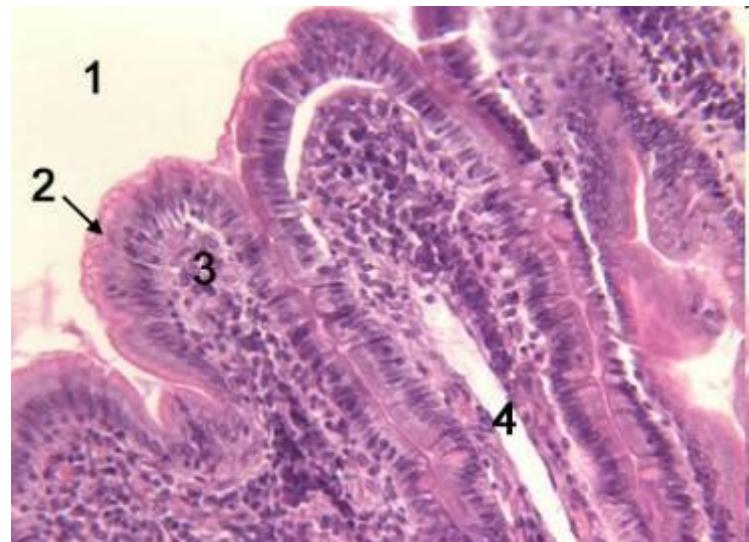

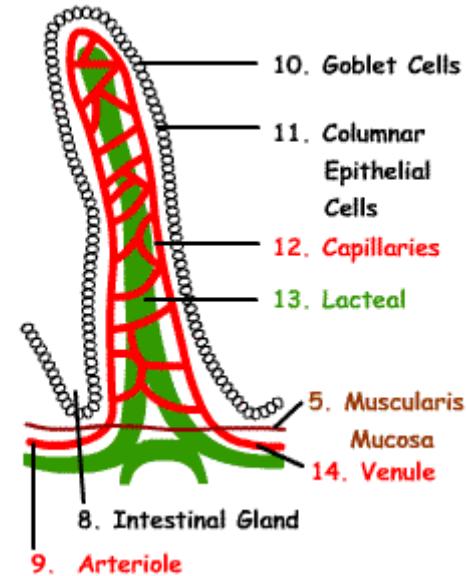

Lymph capillaries

- begin as cul-de-sac
 - fluid flows only inwards
 - plus: viruses, bacteria, tumour cells
- collect superfluous tissue fluid
- no lamina basalis
- regularly one-way valves
- parallel to venules
- collect into lymphatic vessels

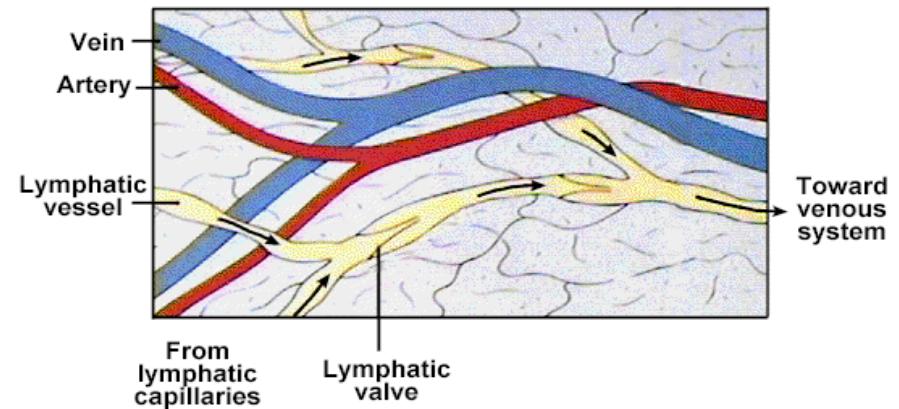

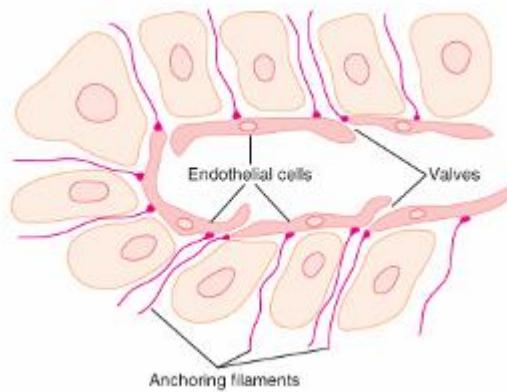

Lymph capillaries within villi

- villi of small intestine
- special arrangement
- lymph capillary in villus axis
- „lacteals“
- lipid absorption (chylomicrones)

Lymph vessels

- thin-walled vessel (thinner than in veins)
- interrupted lamina basalis
- endothelium without pores and *zonulae occludentes*
- *anchoring filaments* (enlarged openings between cells during swelling of surrounding tissue)
- larger amount of vessels
- lymph nodes put in course of lymph vessels
- lymph trunks: rather thick tunica media but thin tunica externa

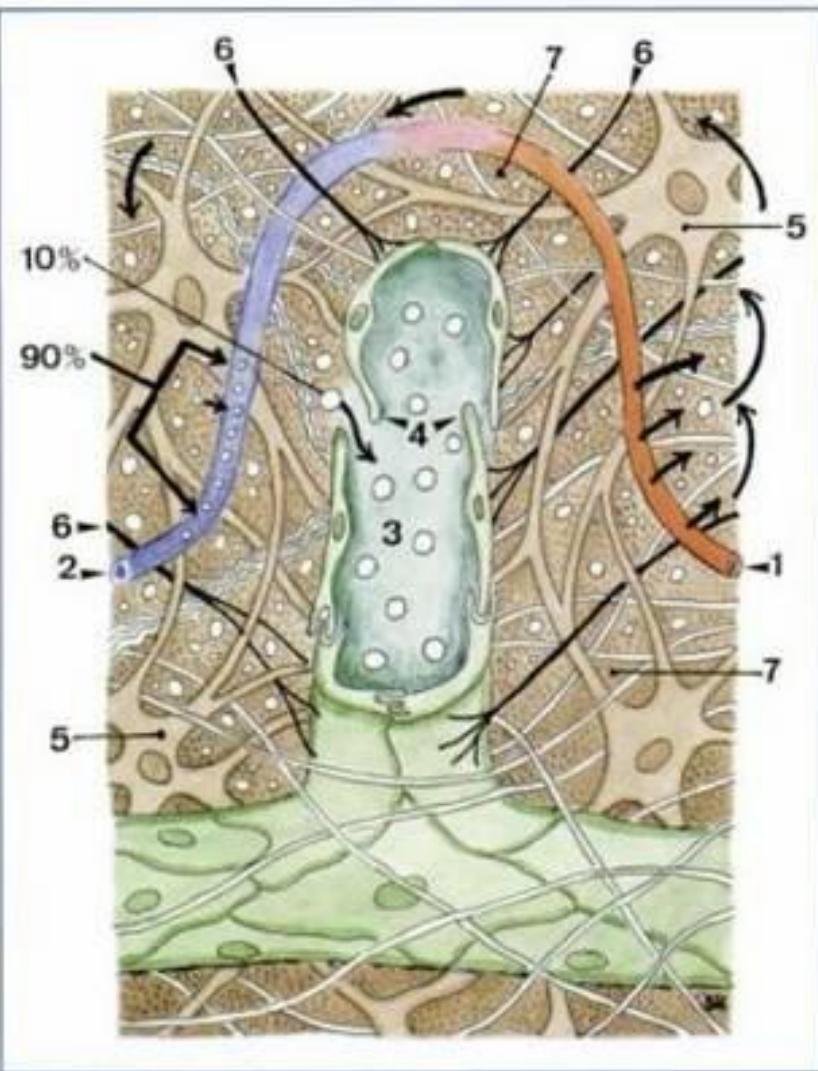

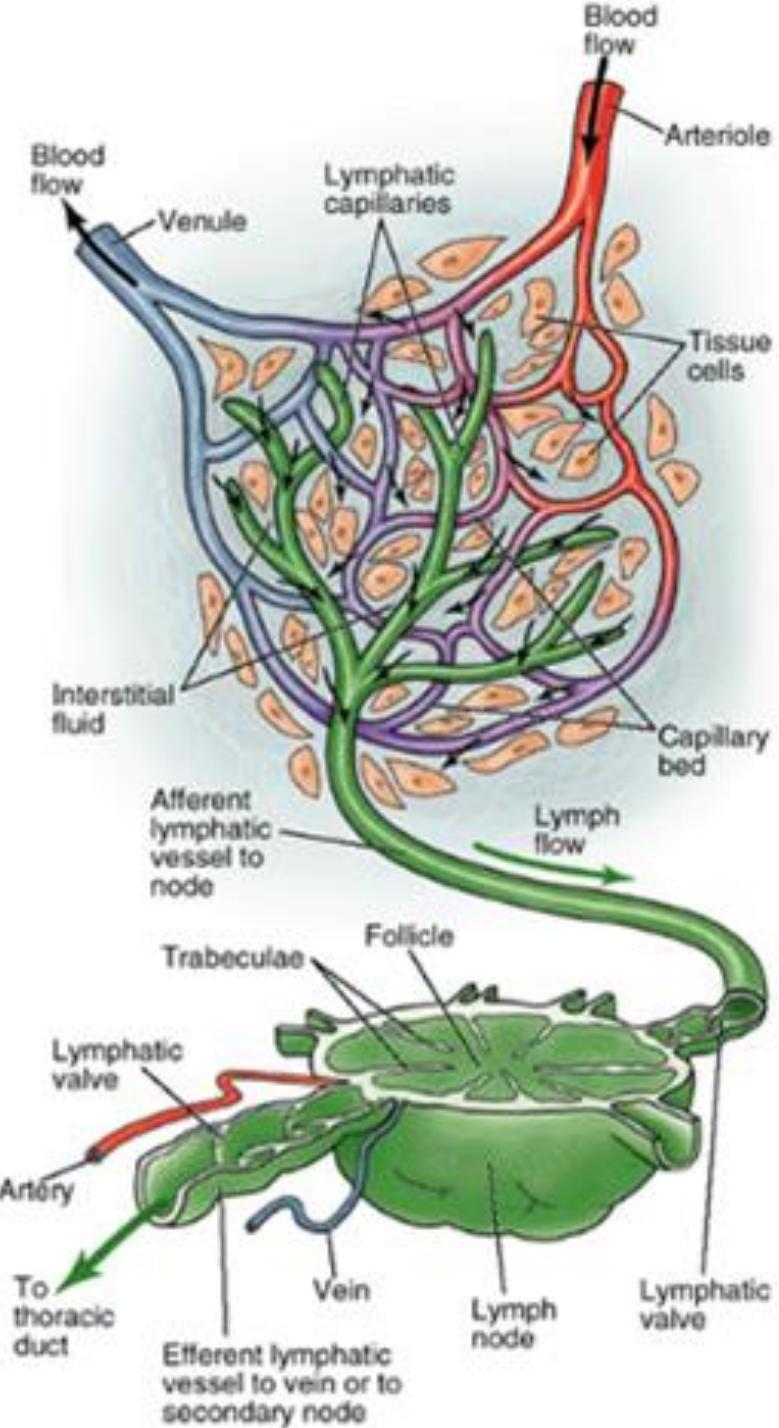

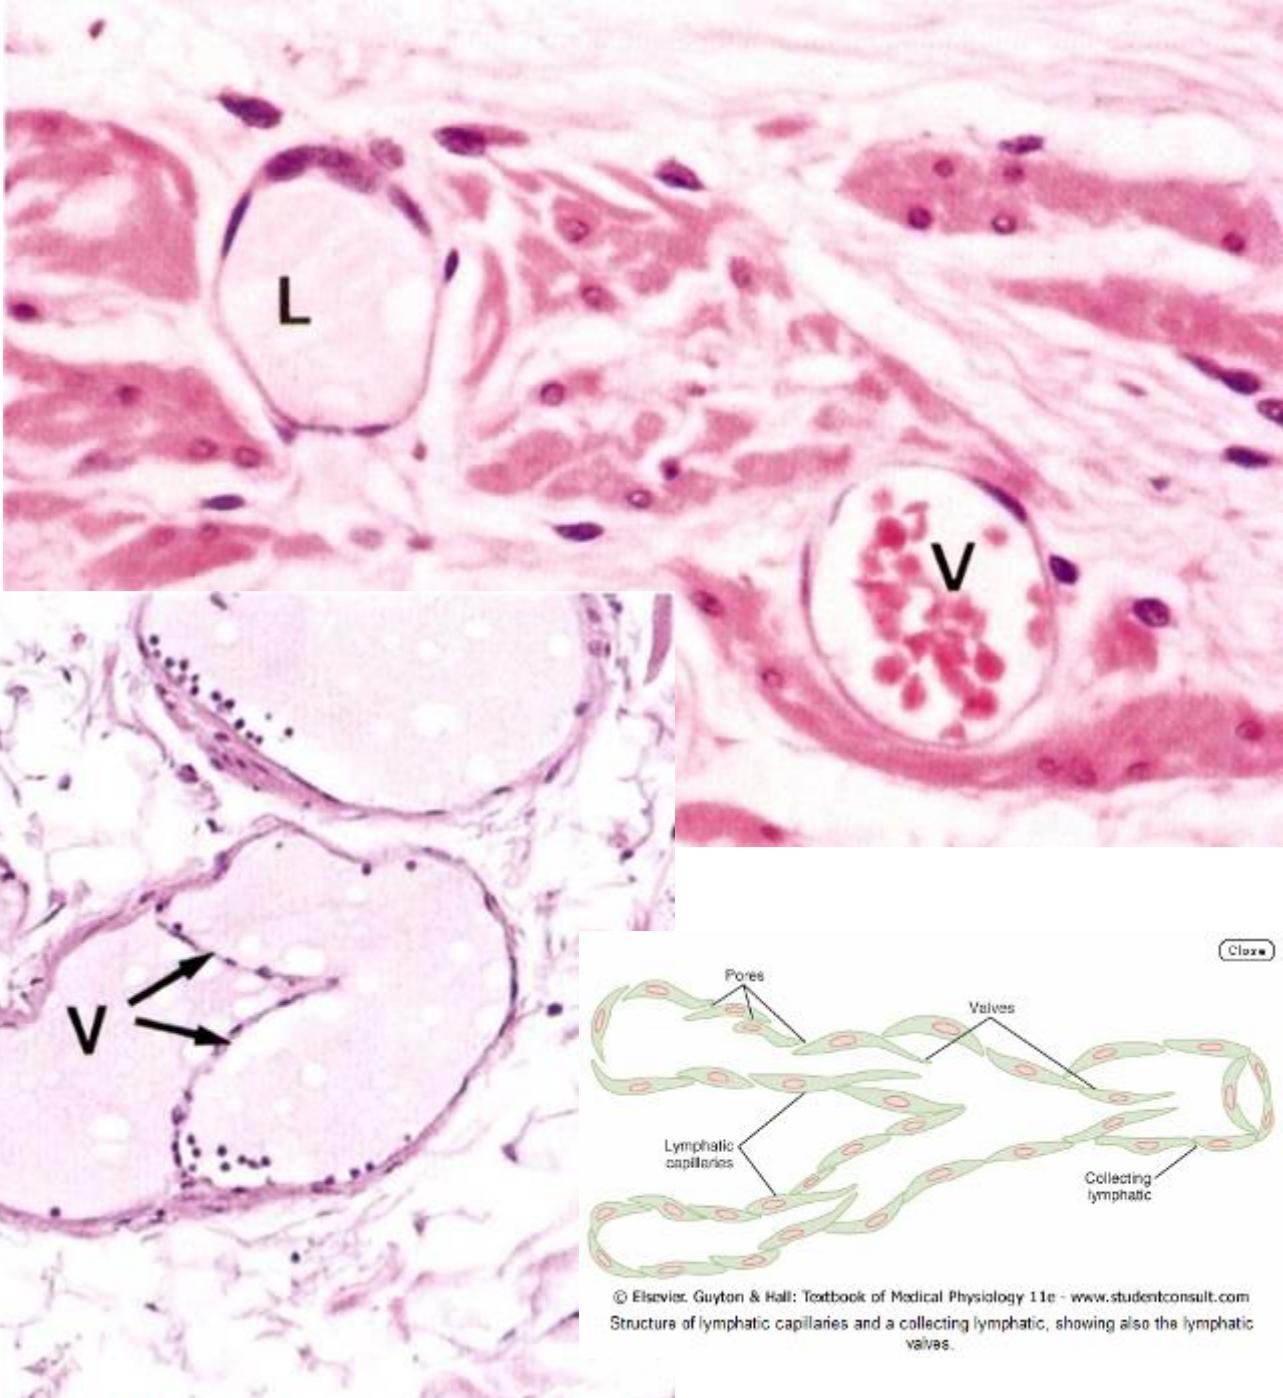

Fig. 1.21 Emplacement of the lymph capillaries in the interstitium

1 Arterial leg of the blood capillary 2 Venous leg of the blood capillary 3 Lymph capillary 4 Open intercellular fissure; swinging tip 5 Fibrocyte 6 Anchoring filaments 7 Intercellular space

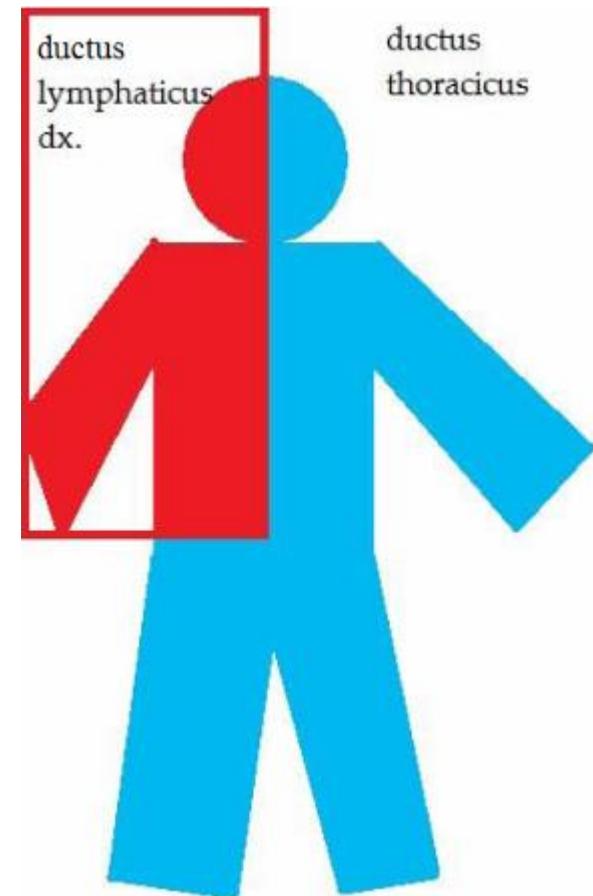

Small arrows mark the direction of blood flow; the larger arrows indicate the flow of intracellular fluid [M 124]

Lymph vesels

Lymph vessels general arrangement

- lymph capillaries → lymph vessels
- limbs (collectors): superficial → deep vessels
- organs: plexuses (subcapsular + deep) → lymph trunks → lymph ducts
- lymph nodes put in vessels

Lymph ducts

2 lymph ducts

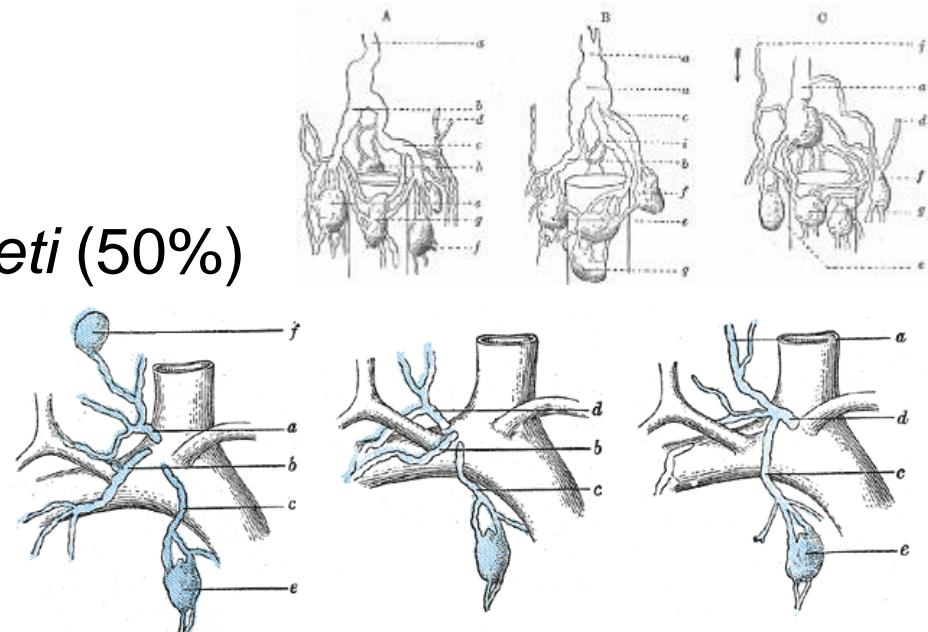

- irregular division of body (drainage areas)

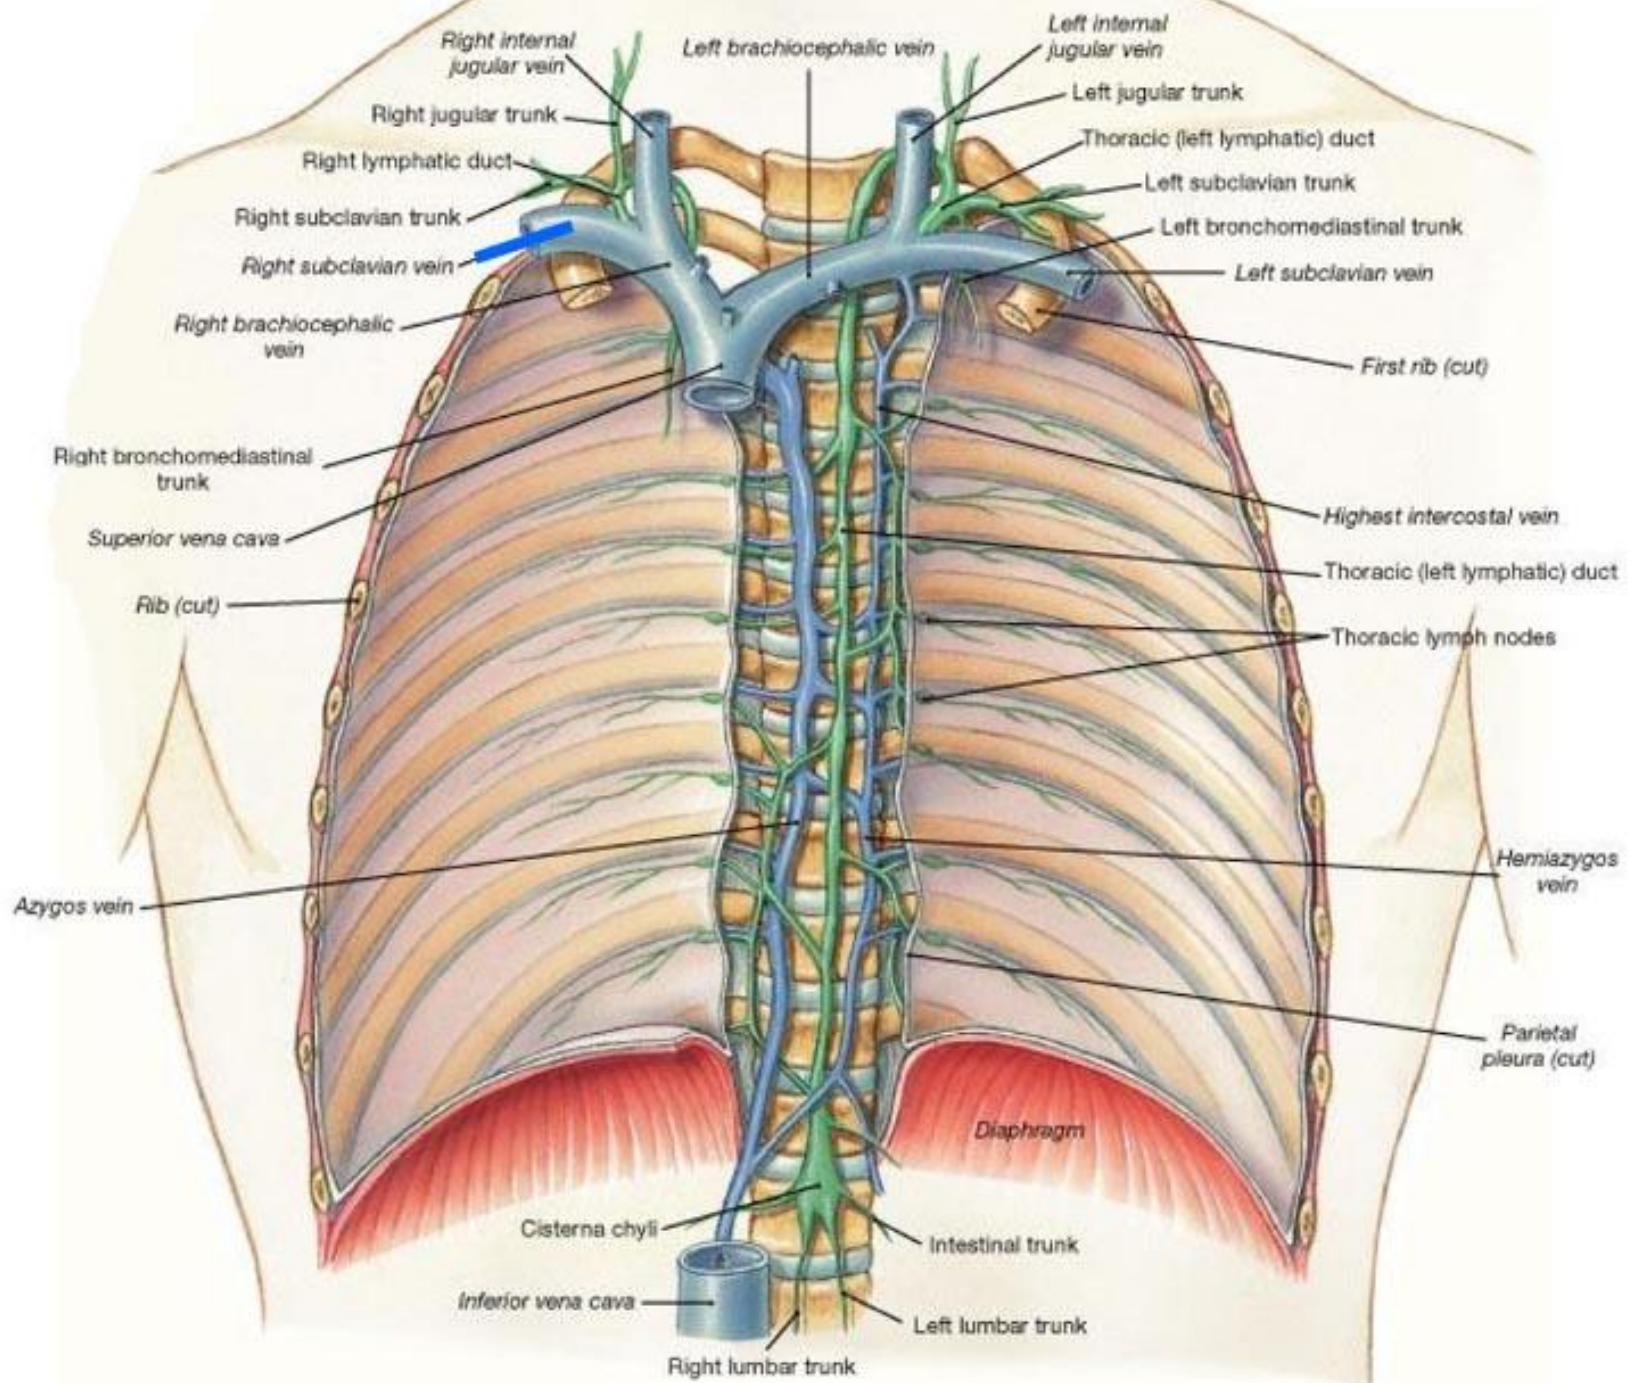

- **ductus thoracicus**

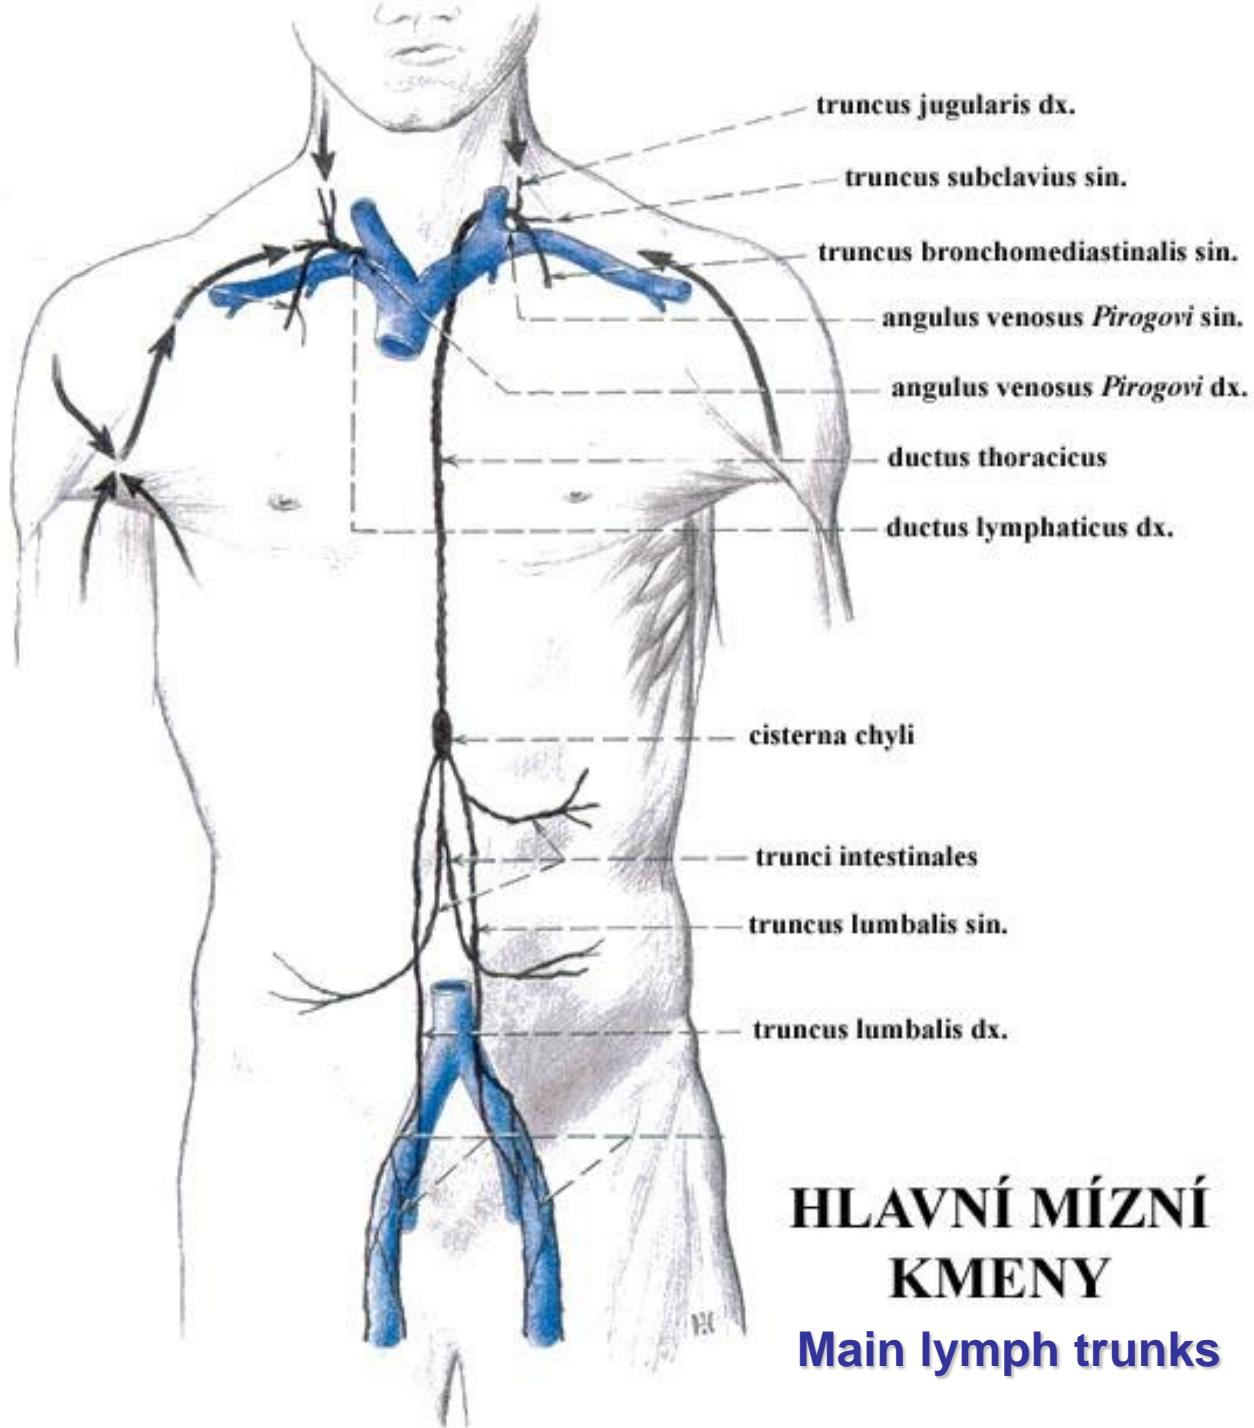

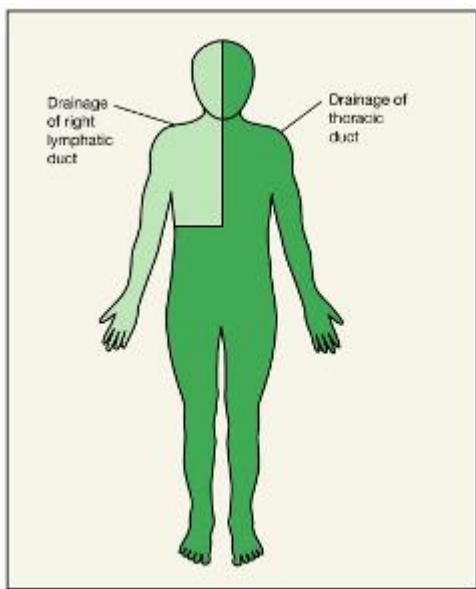

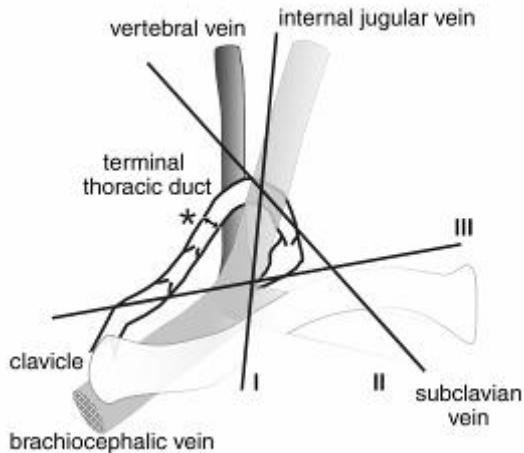

- pars abdominalis
 - cisterna chyli *Pecqueti* (50%)
- pars thoracia
- pars cervicalis
- arcus d.t.

- **ductus lymphaticus dexter**

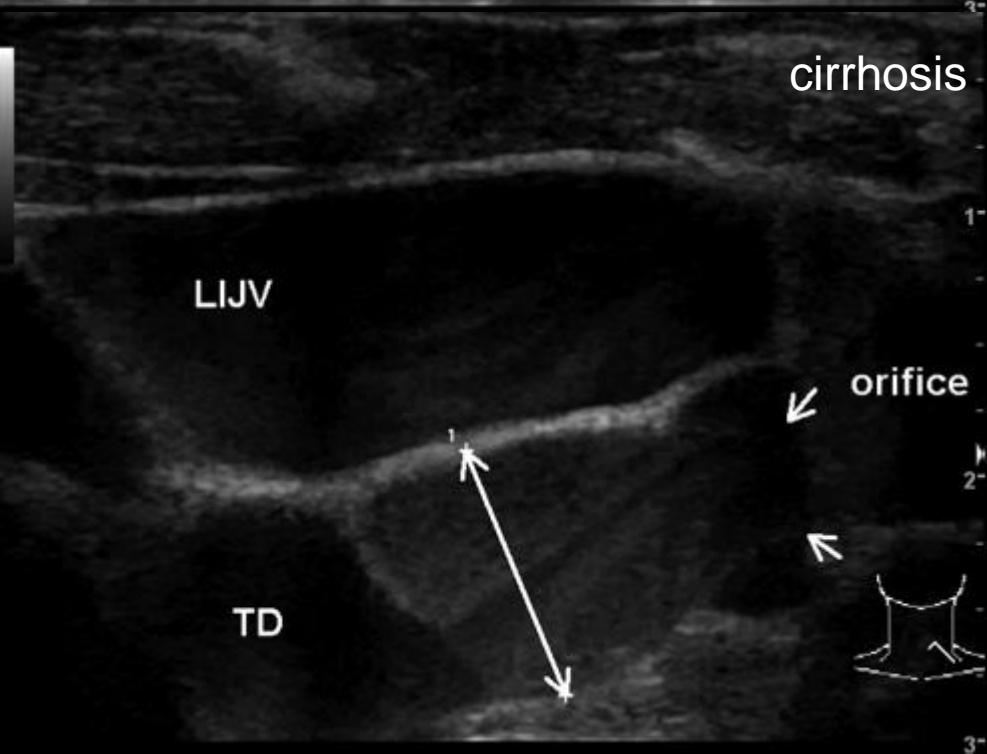

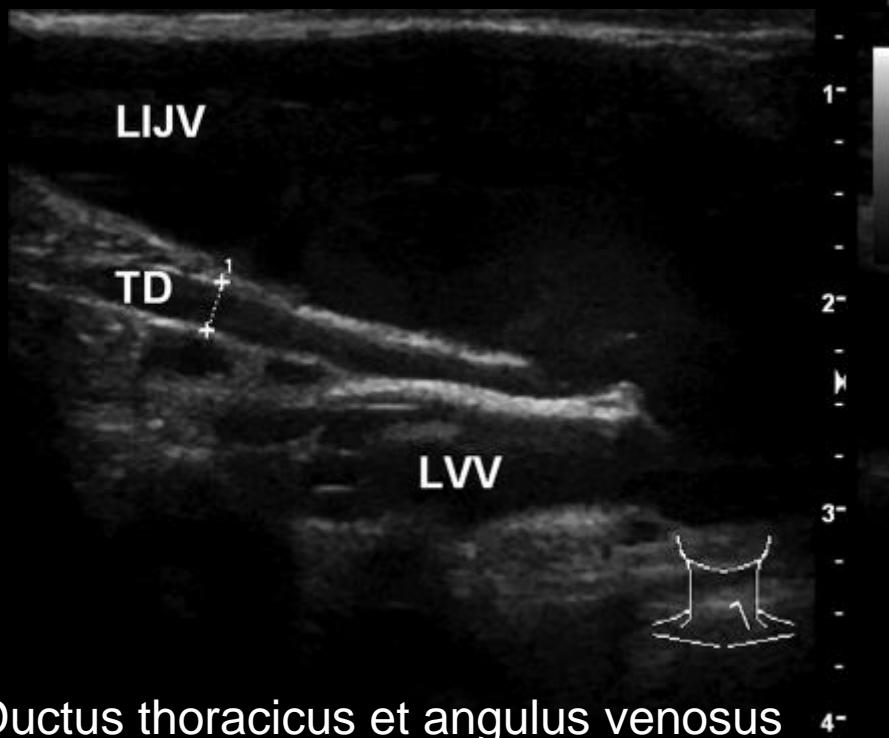

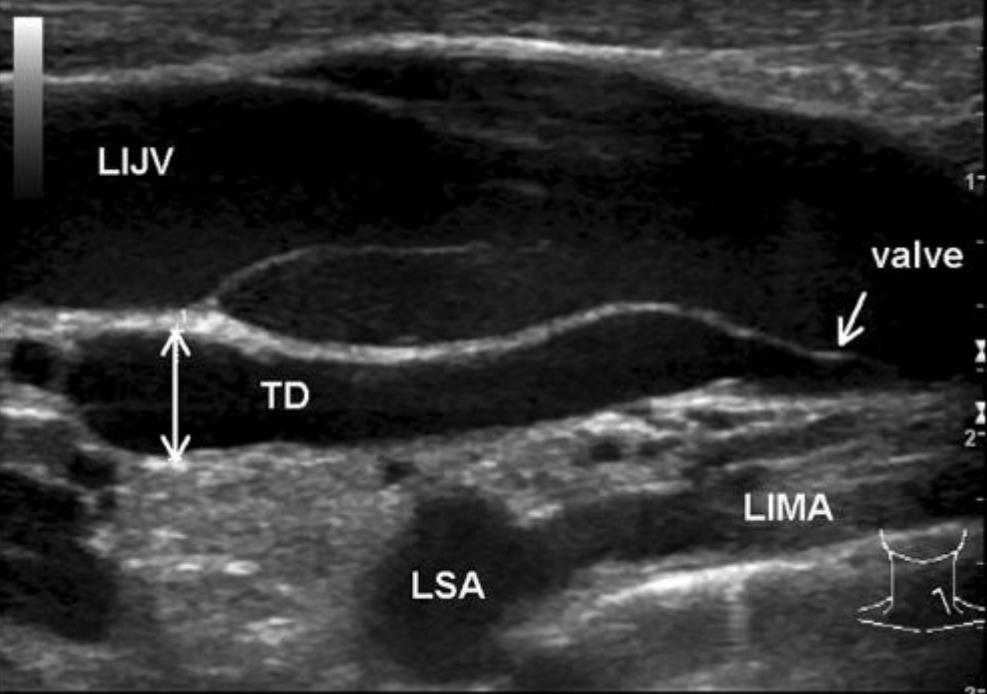

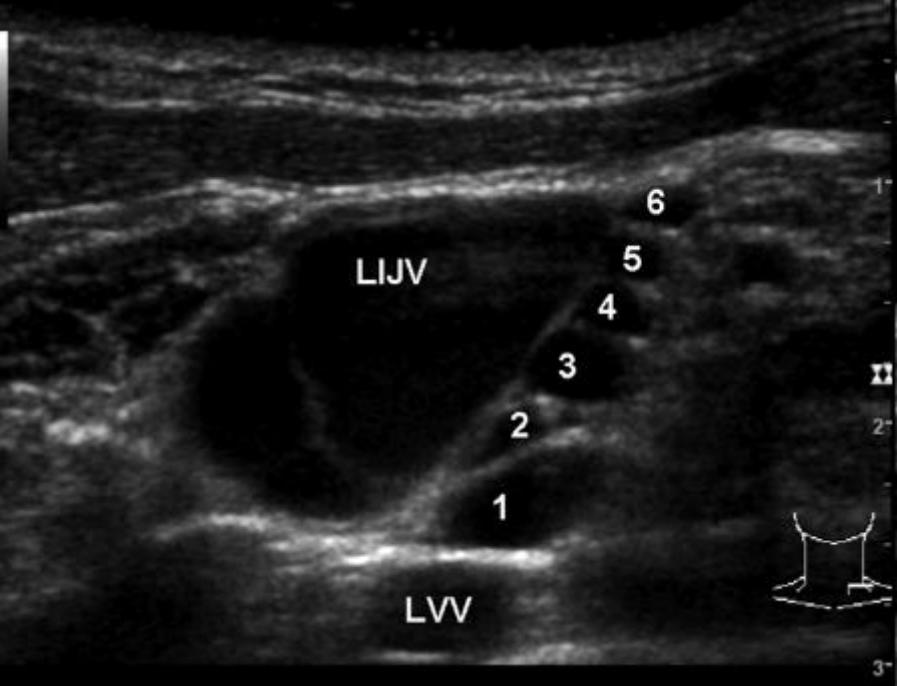

9 lymph trunks

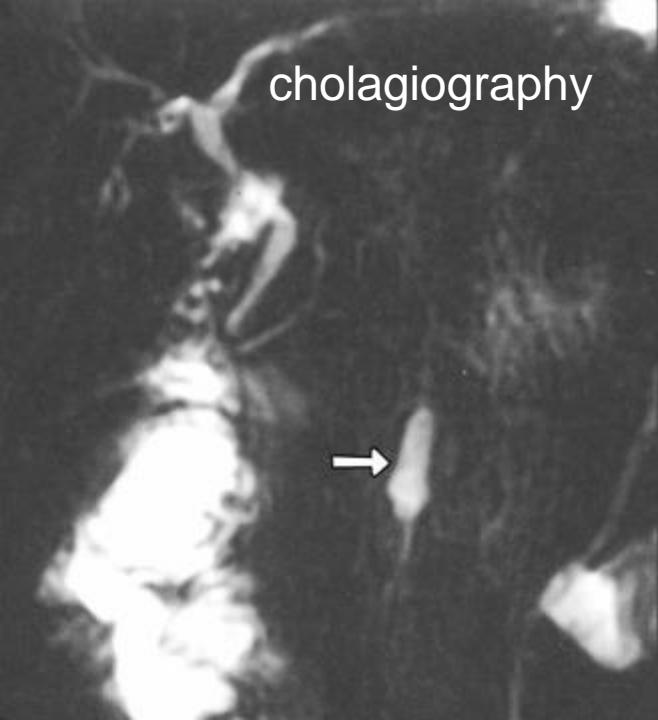

**HLAVNÍ MÍZNÍ
KMENY**
Main lymph trunks

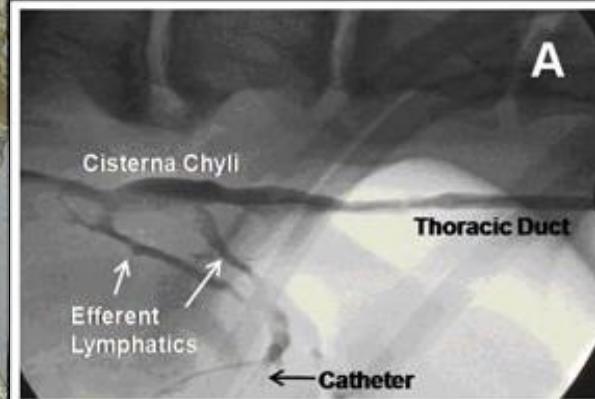

Ductus thoracicus et angulus venosus

cholangiography

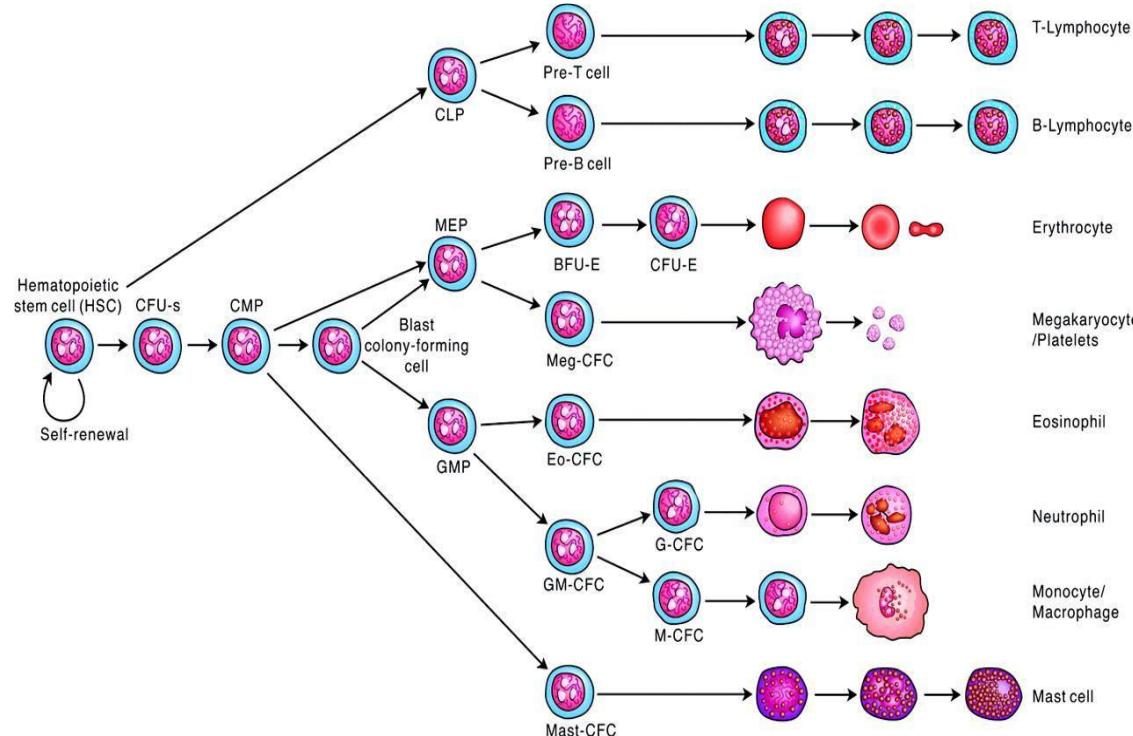

CISTERNA
CHYLI

Lymphatic tissue

- morphological substrate for the majority of immune reactions
- cells derived from the pluripotent haematopoietic stem in bone marrow

Functions of cells

- **neutrophil leukocytes** and **monocytes/macrophages** participate in innate immune response
- **lymphocytes (T and B)** are involved in the acquired immunity
- antigen-presenting **dendritic cells** care for specific immune response, being located in epithelia
 - they migrate to lymph nodes where they „teach“ the T-lymphocytes
 - lymphocytes activated by antigen-presenting cells participate in anti-infectious immunity and in anti-cancer immunological surveillance

Lymph organs

= acquired (adaptive, specific) immunity

- primary (central) lymph organs

- *thymus*
 - bone marrow (*medulla ossium*)
 - *bursa Fabricii – birds*

function: cell production de novo, differentiation and maturation of immunocompetent cells

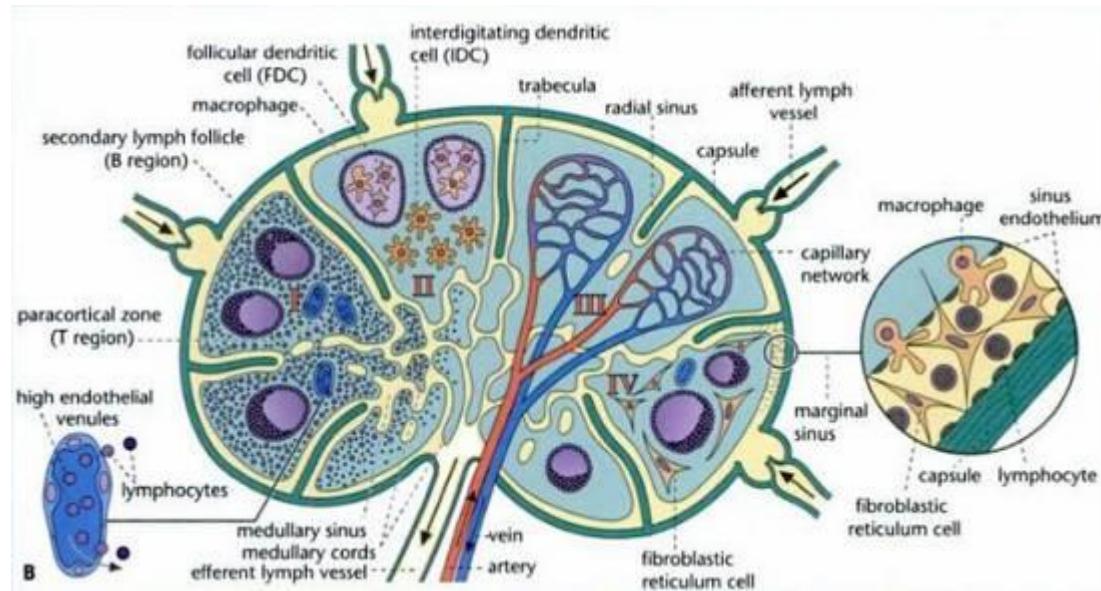

- secondary (peripheral) lymph organs

- spleen = *splen (lien)*
 - **lymph nodes = *nodi lymphoidei***
 - **tonsils = *tonsillae***
 - **lymph nodules = *noduli lymphoidei***

function: contact with antigen-presenting cells, production of mature lymphocytes

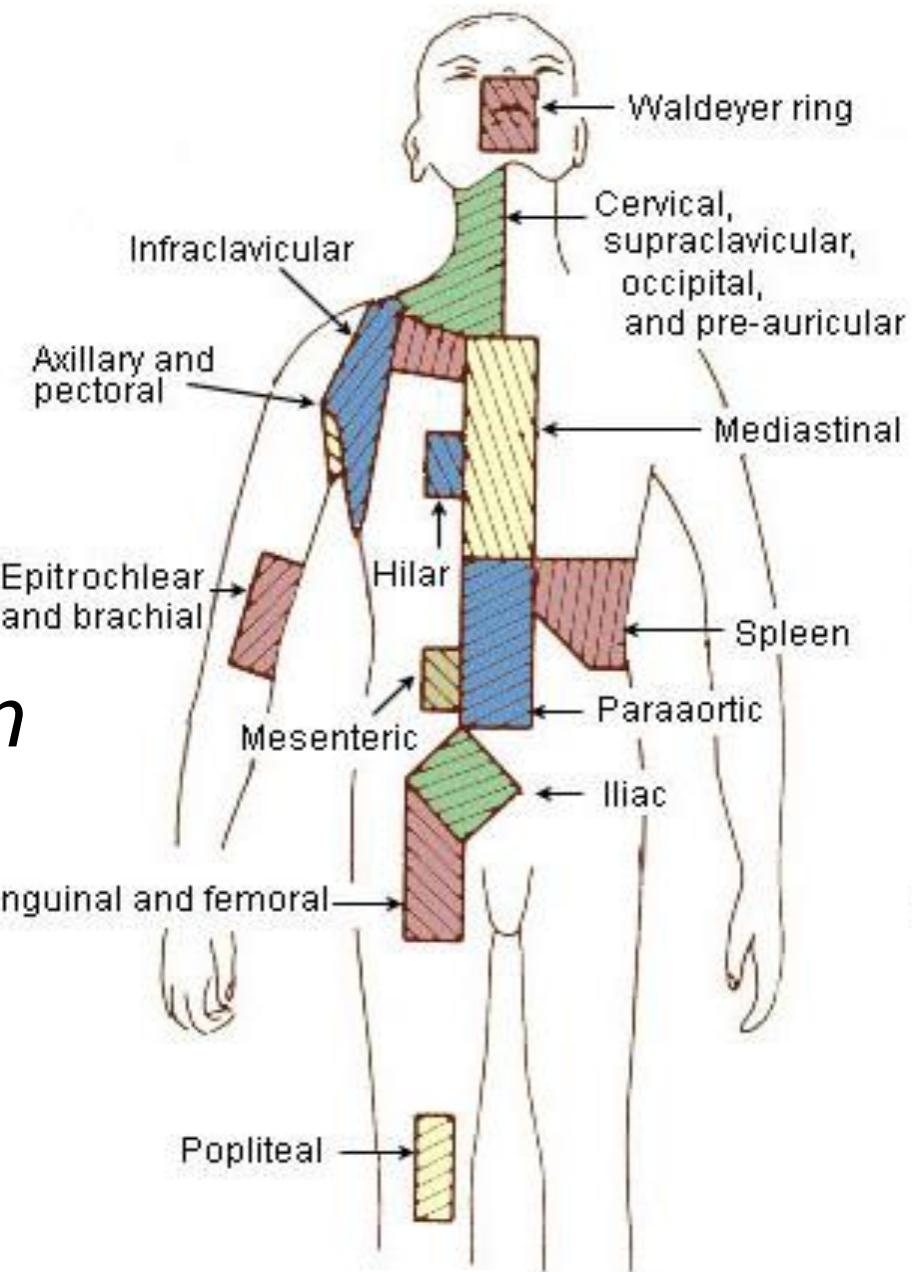

Lymph nodes

- lymph filtration
- antigen presentation
- activation, differentiation and proliferation (production of mature B- and T-lymphocytes)
- lymphocytes, macrophages, plasmatic cells

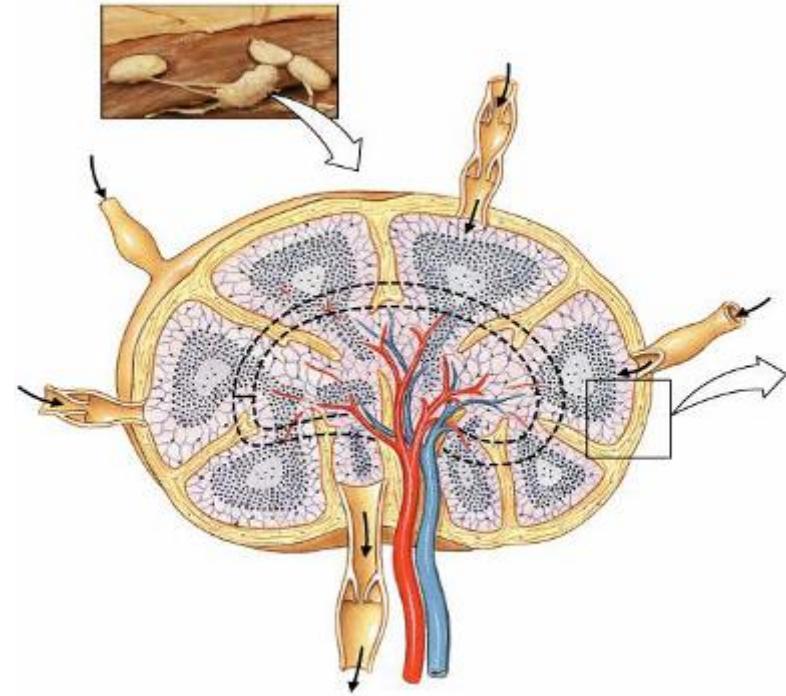

Lymph node

- **nodus lymphoideus**
(nodus lymphaticus;
lymphonodus)
- about 500 in body
- Ø 1-25 mm
- *swelling in inflammation
(painful)*
- *metastasis catching
(in painful swelling)*
- „*lymphadenopathy*“

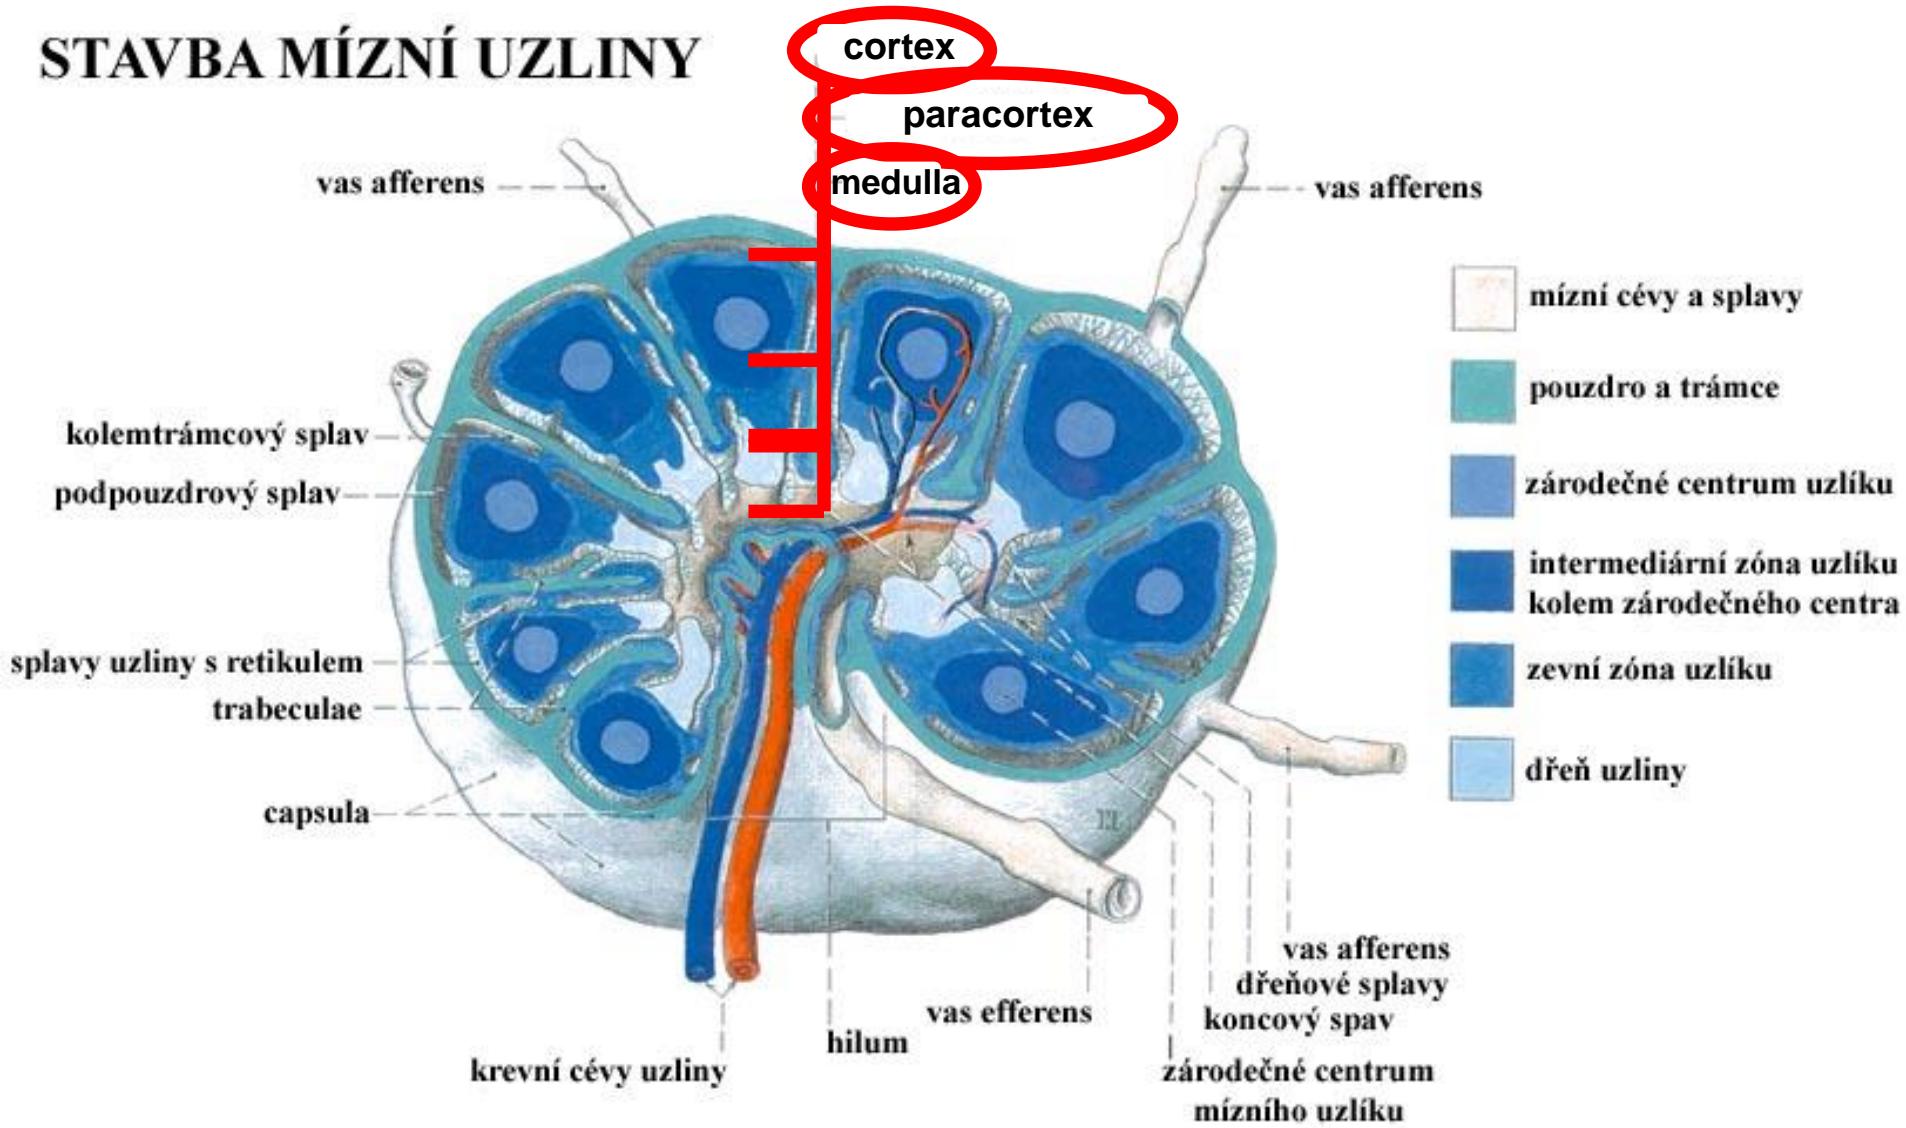

Lymph node

- capsula → trabeculae
- hilum
- cortex (+ paracortex)
 - reticulin network
- medulla
- convex part – „afferent“ (more afferent lymph vessels)
- concave hilum – „efferent“ (one efferent lymph vessel + blood vessels)

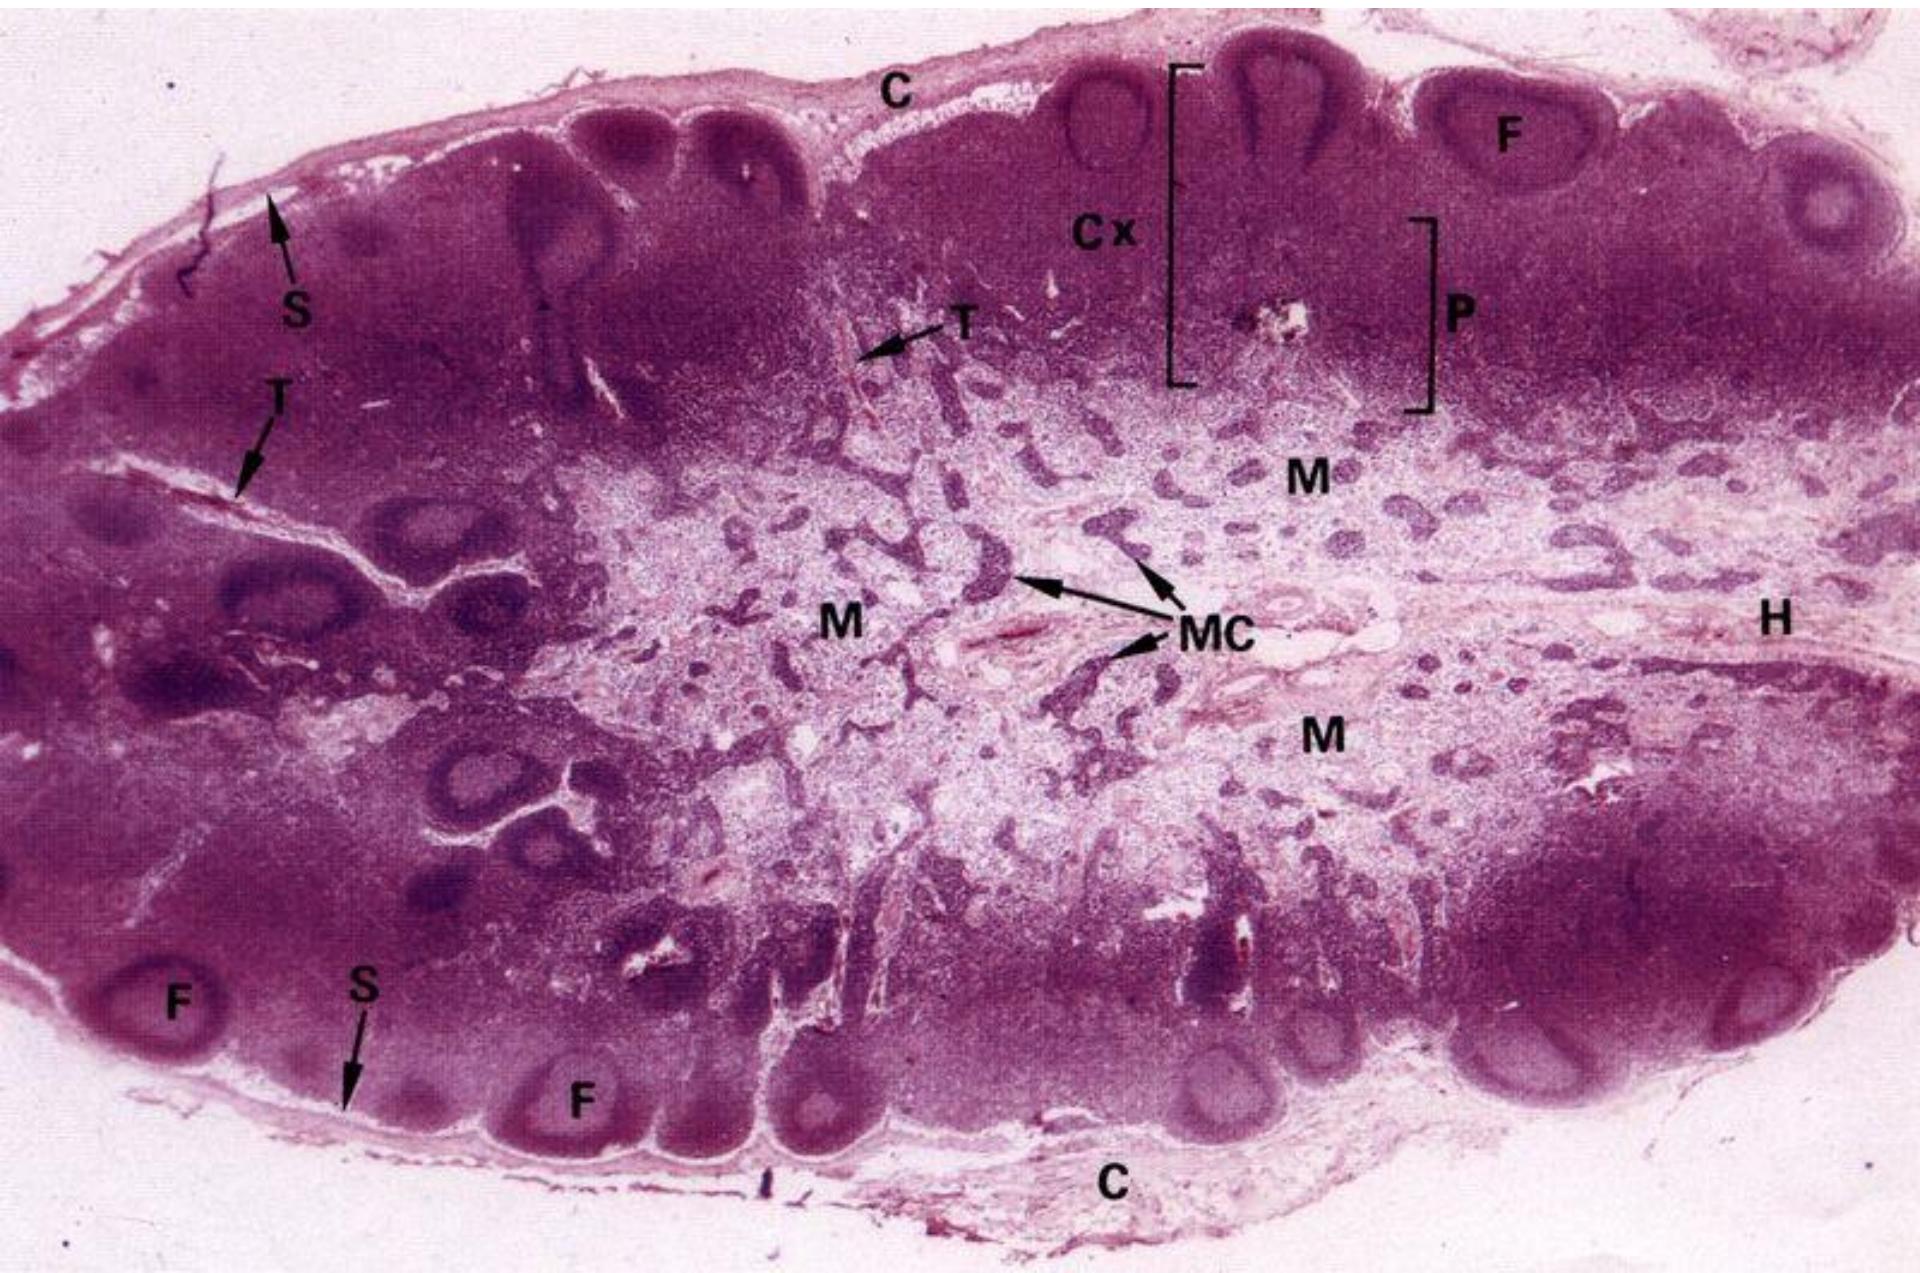

Lymph node

STAVBA MÍZNÍ UZLINY

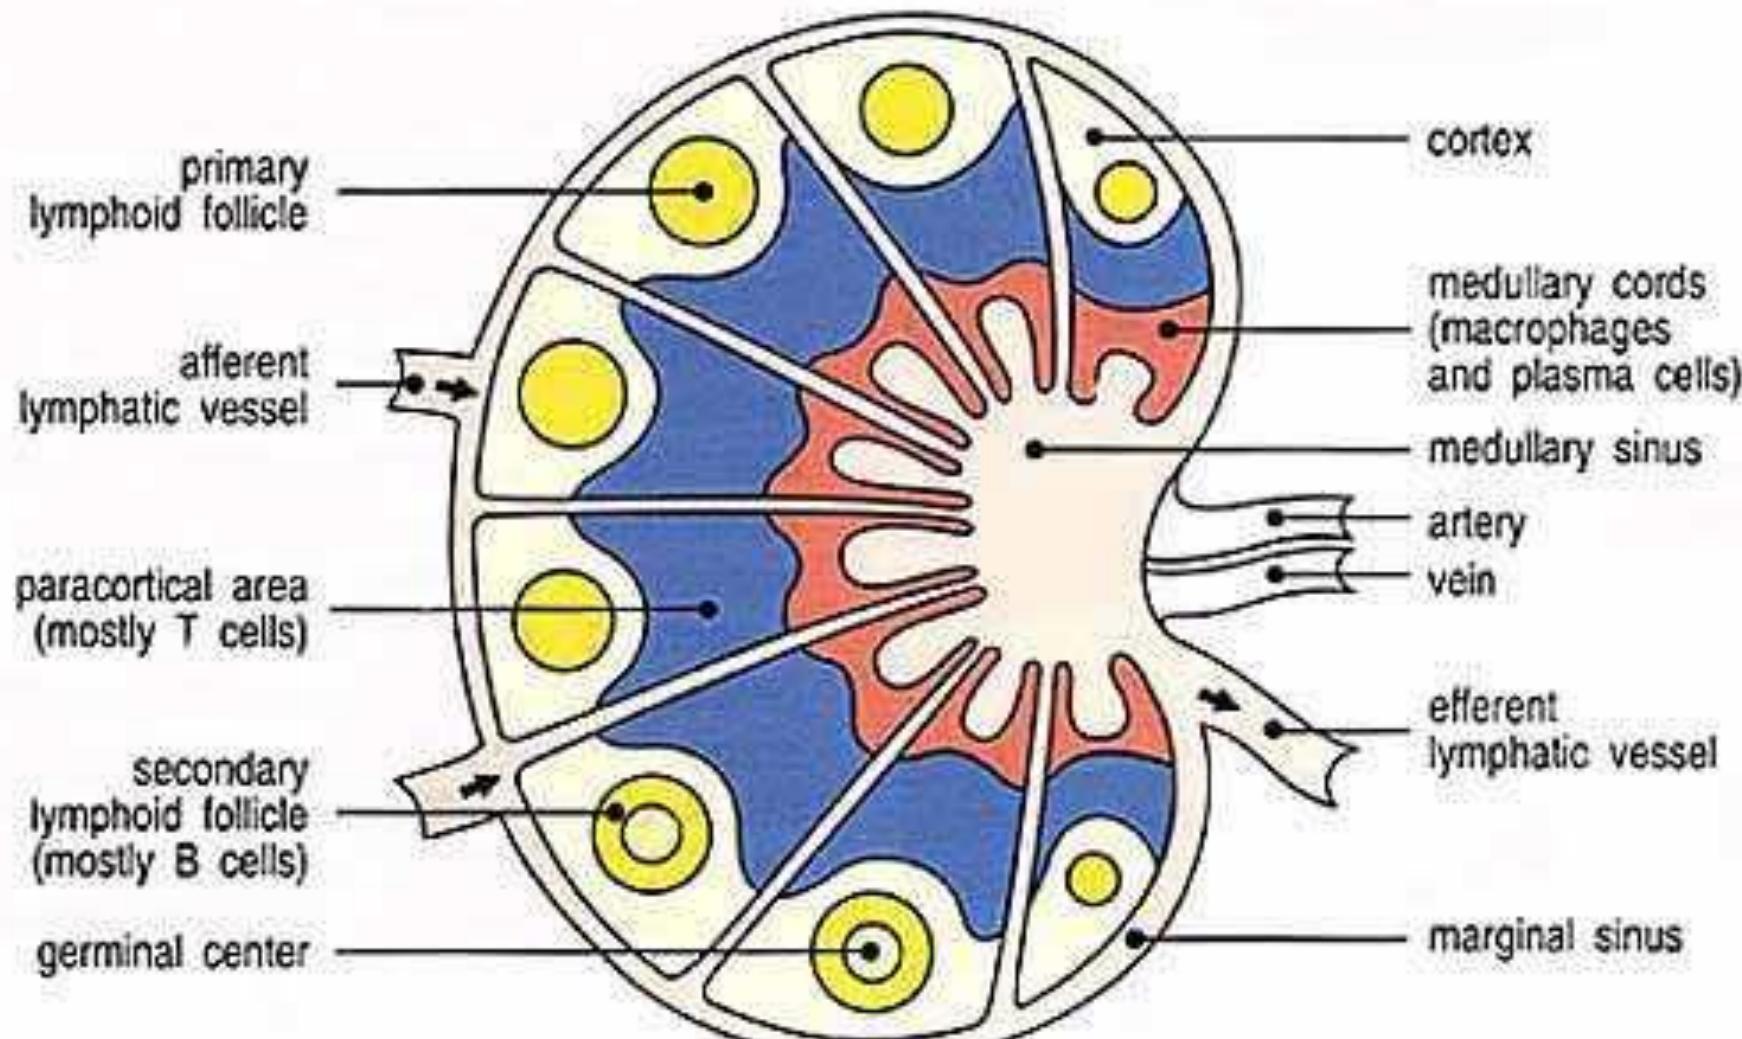

Lymph node - HE (x 8)

Lymph node – cortex

- outer cortical zone (**cortex**)
 - sinus subcapsularis
 - lymph nodules (*noduli lymphoidei*)
 - sinus internodulares
 - **B-lymphocytes**
- inner cortical zone (**paracortex**)
 - **T-lymphocytes** (CD4, CD8)
 - *dendritic cells*
 - no lymph nodules
 - venulae altoendotheliales
 - high endothelium

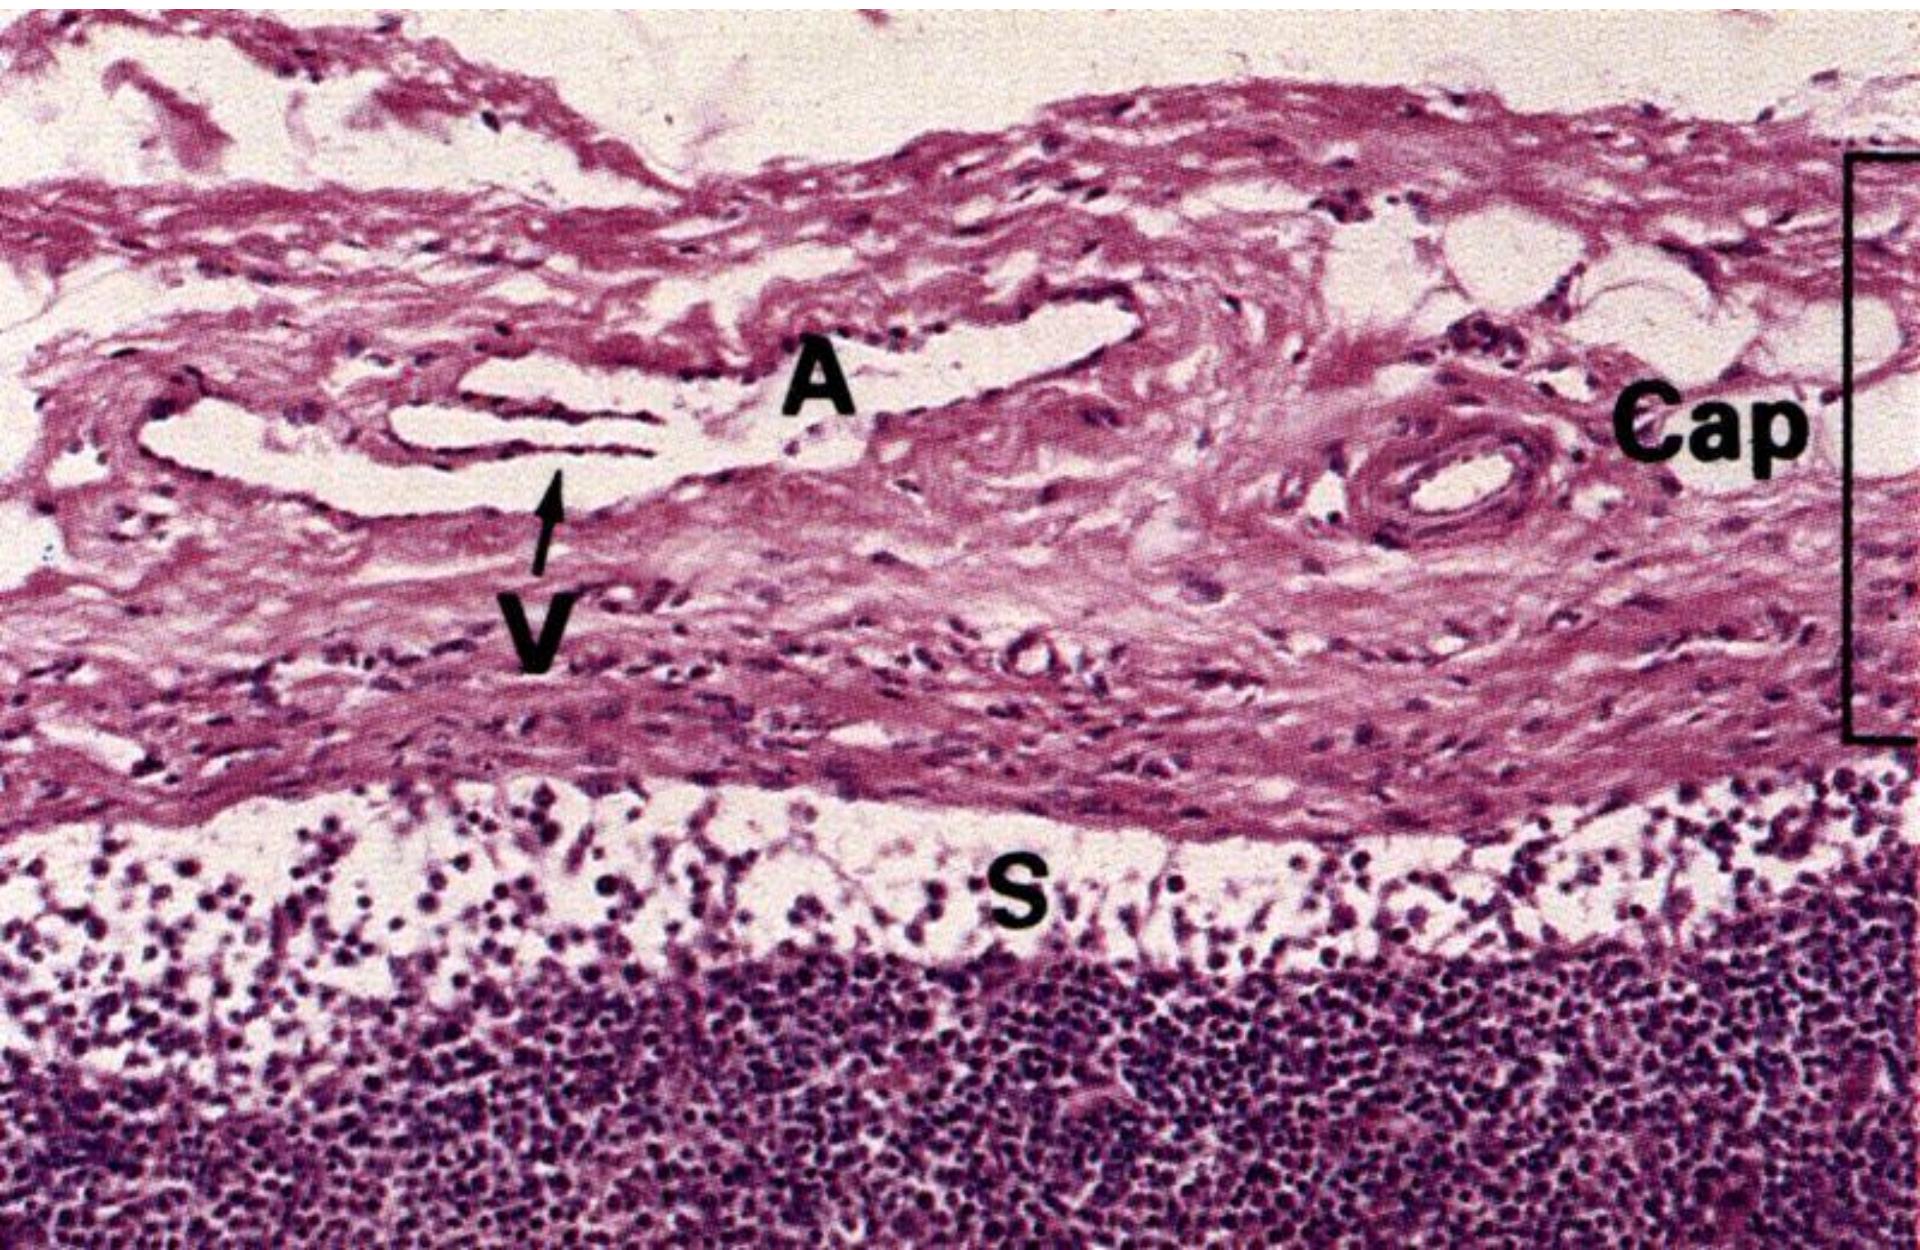

The lymph node

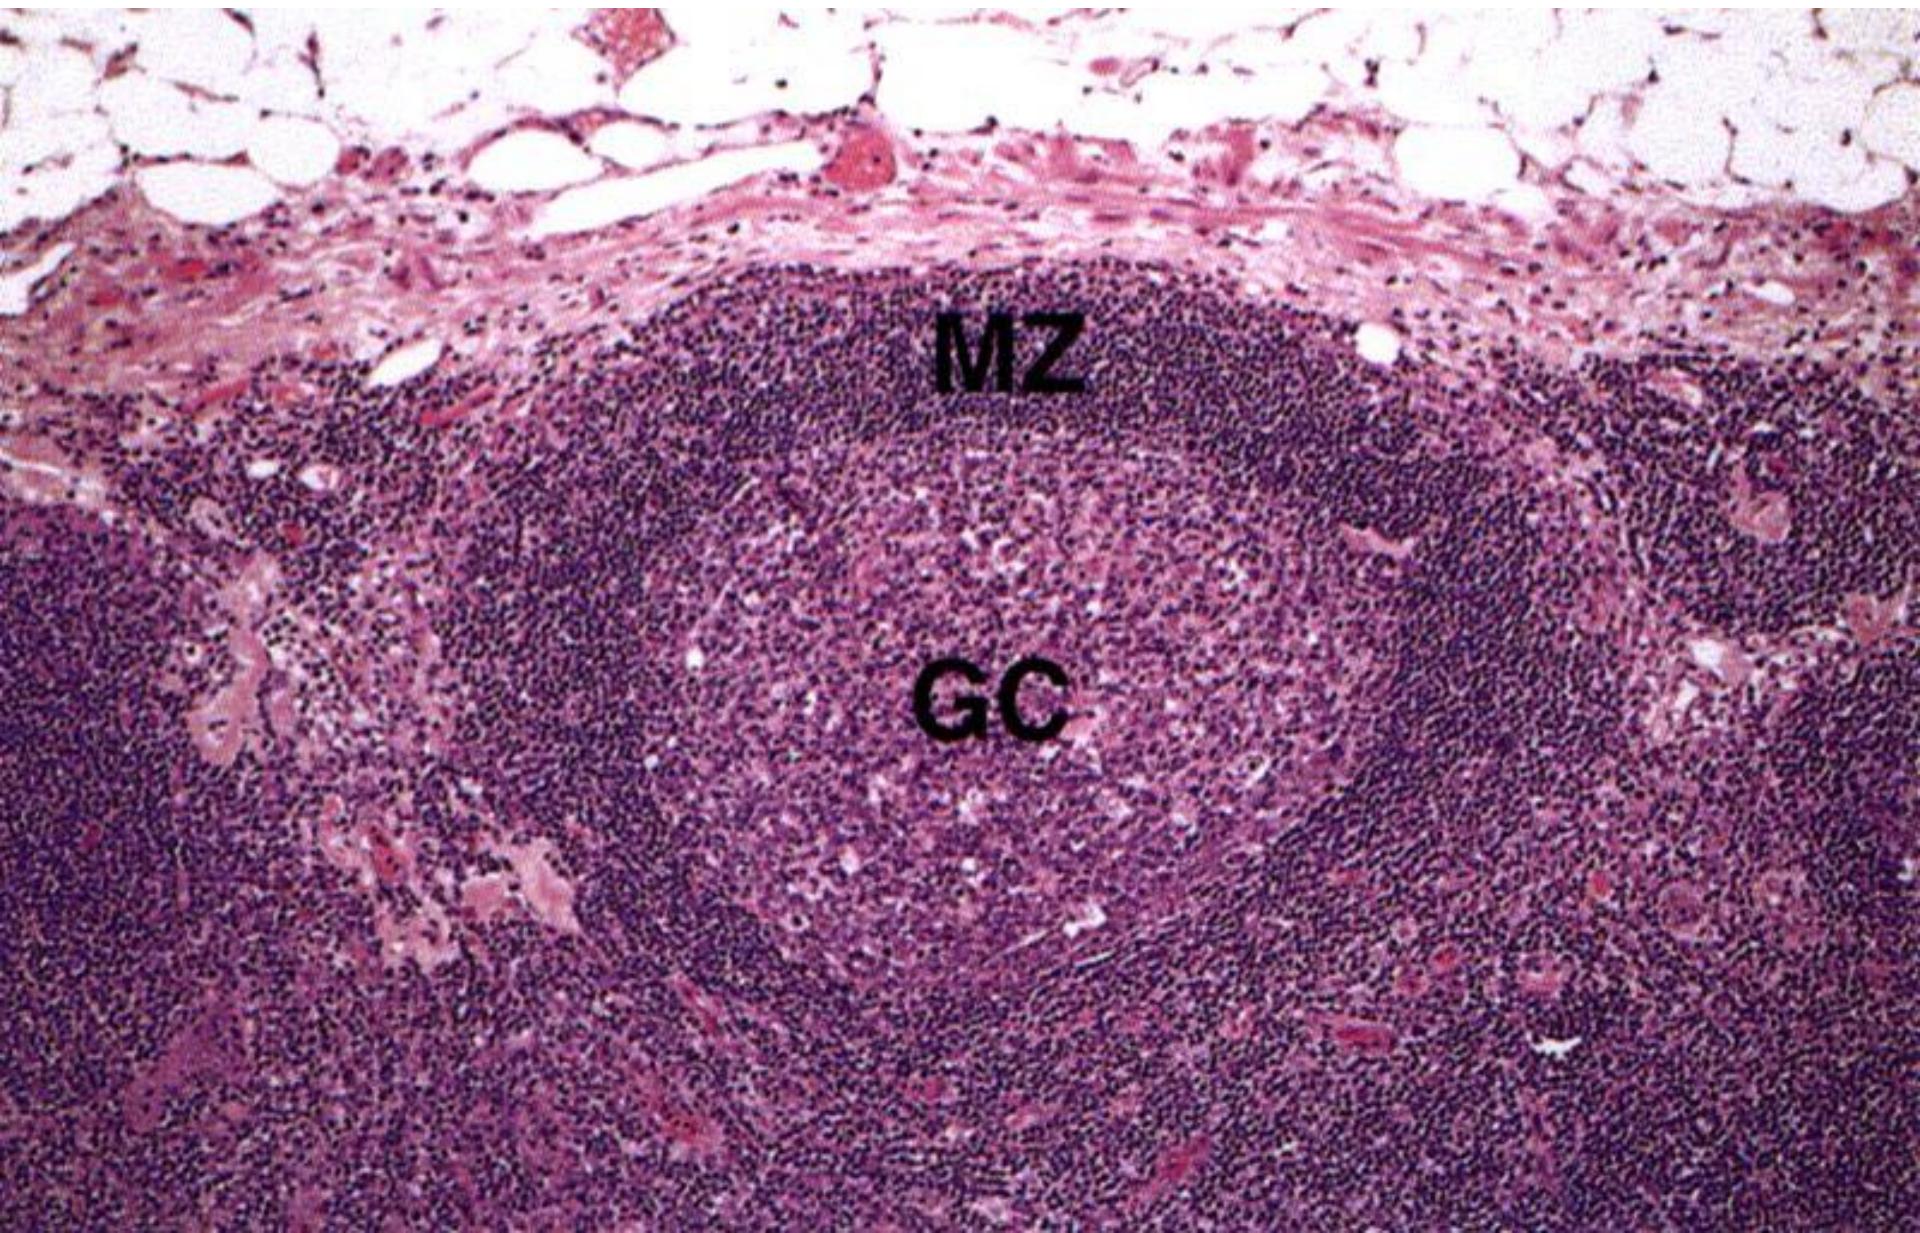

Lymph node – cortex: cells and zones noduli lymphoidei

- B-lymphocytes
- follicular dendritic cells (FDC)
- primary nodule
 - small „naive“ B-lymphocytes
- secondary nodule
 - germinal center: antigen-stimulated B-lymphocytes (large, less deeply staining, more rapidly dividing)
 - dark zone: centroblasts
 - light zone: centrocytes
 - other cells: T-lymphocytes (help maturation of B-lymphocytes), macrophages (phagocytic apoptotic cells)
- mantle zone
 - produced as surrounding cells are marginalized by rapidly growing germinal centre
 - naive B-lymphocytes, T_H-lymphocytes, FDC, macrophages

Lymph node - HE (x 128)

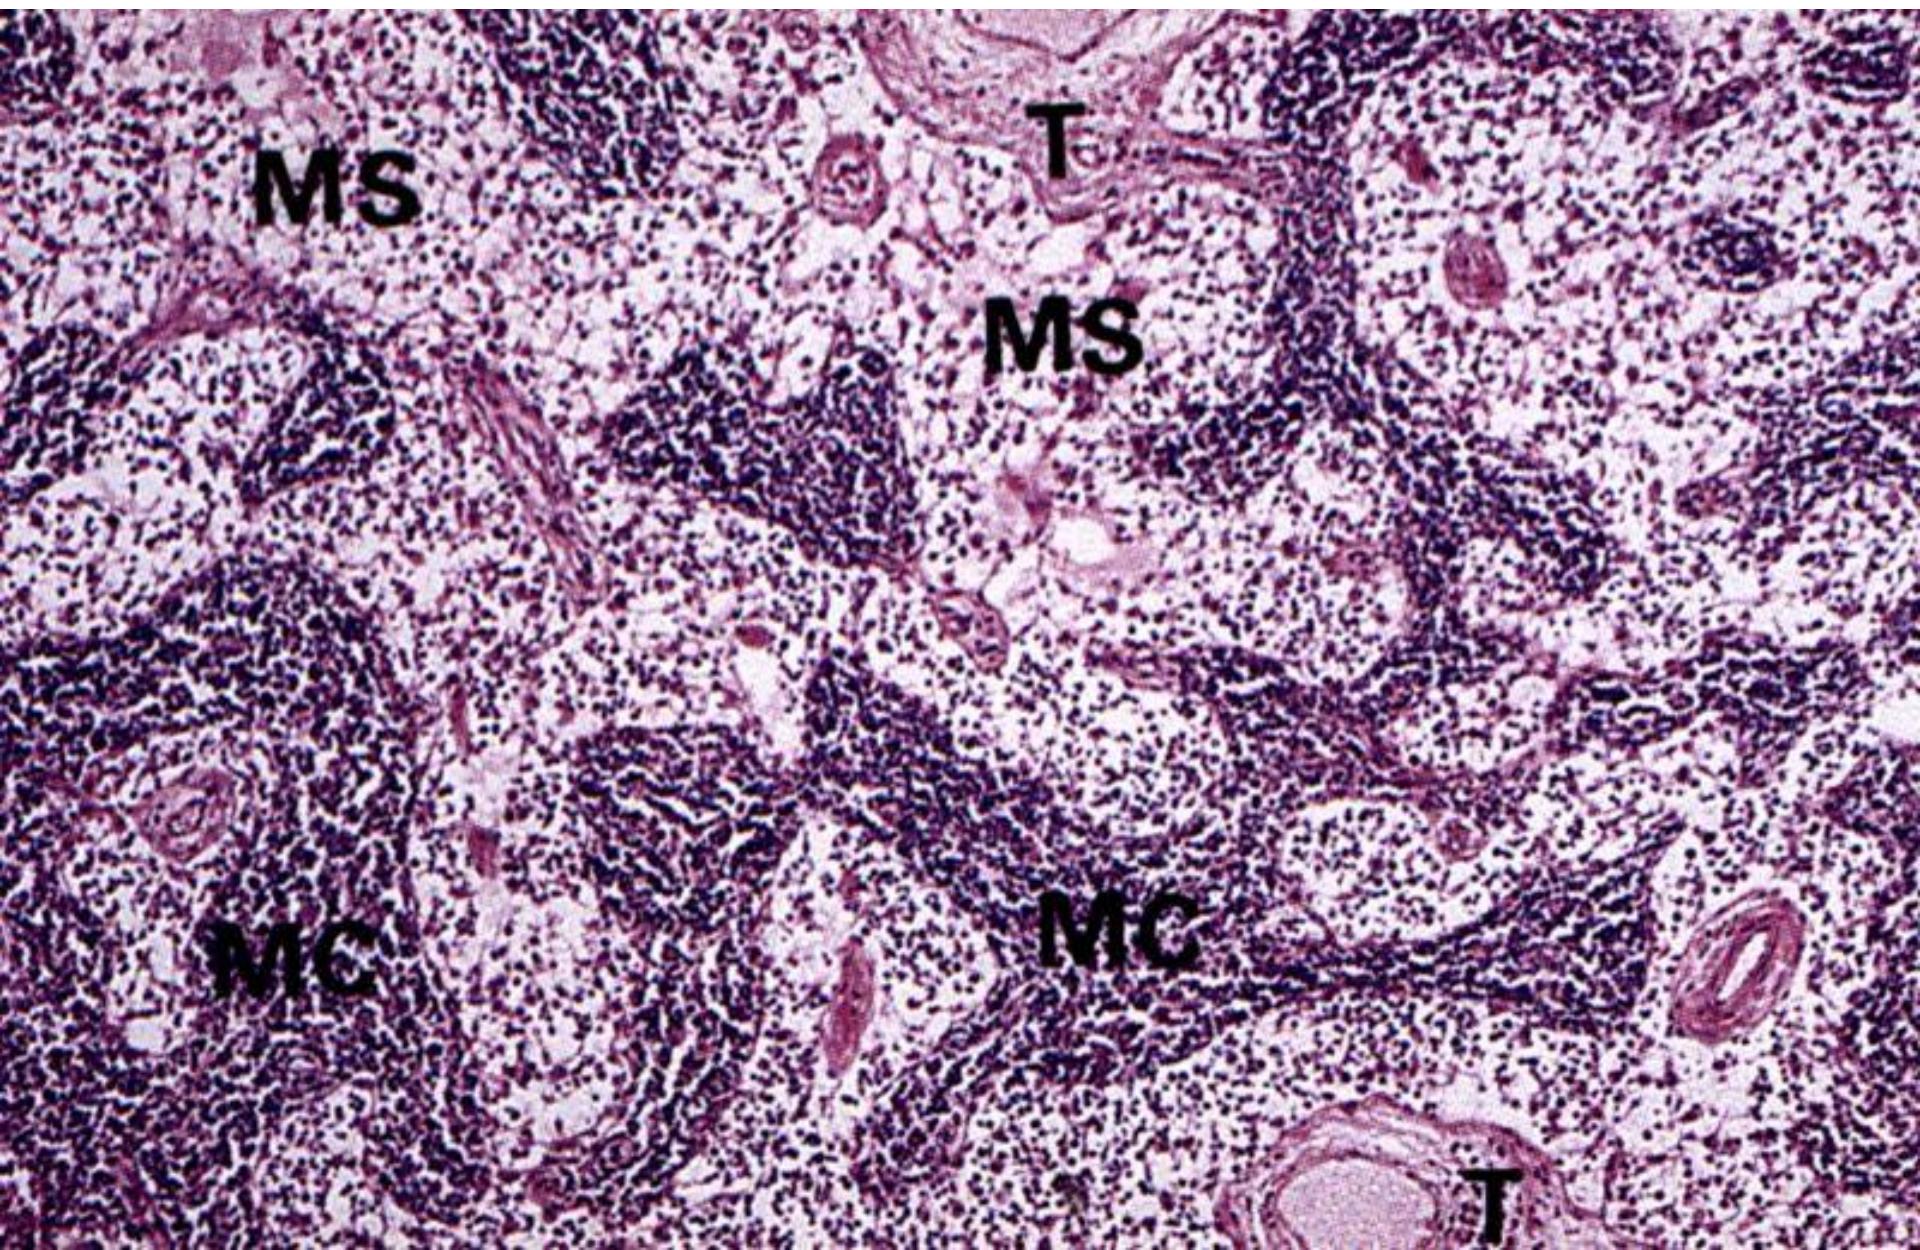

Lymph node - HE (x 50)

Lymph node – medulla

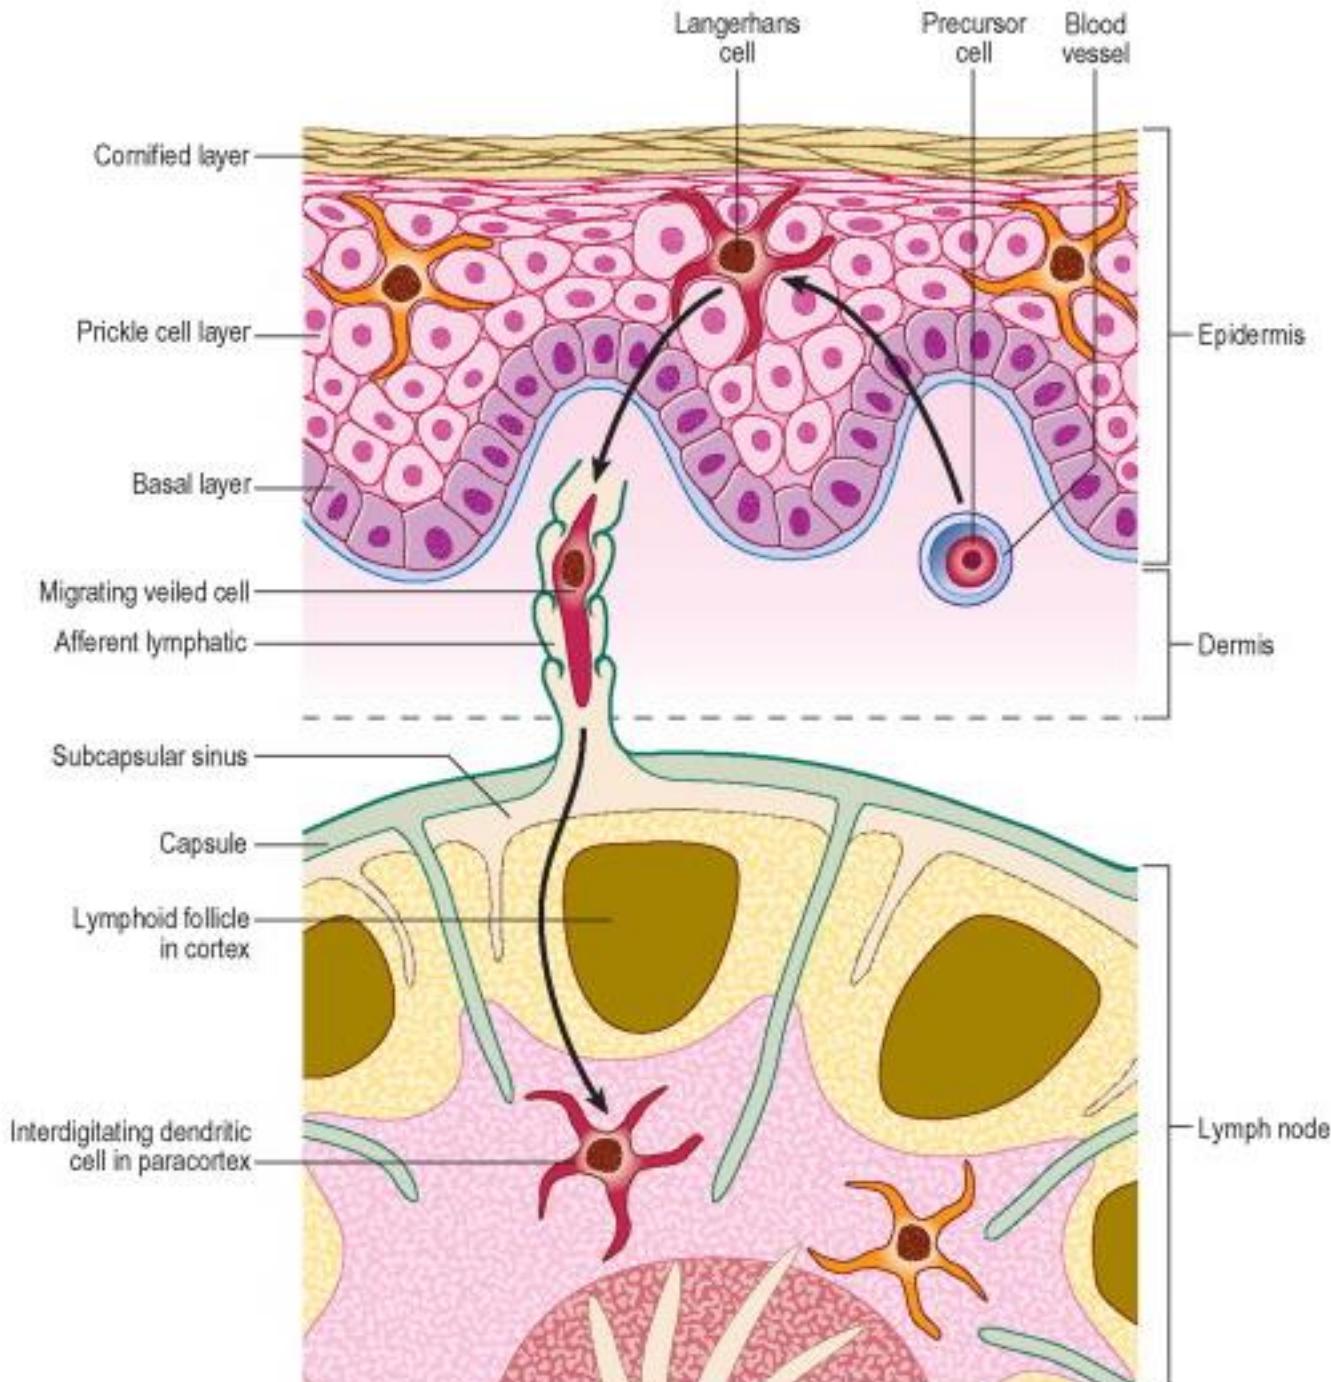

- chordae medullares (medullar cords)
 - processes of cortical lymphoid tissue
 - many *B-lymphocytes and plasmatic cells*
 - *dendritic cells (antigen-presenting cells)*
- sinus lymphaticus medullaris
 - lined with *reticular cells* and *macrophages*
 - reticular fibers cross sinuses – web

Lymph node - HE (x 20)

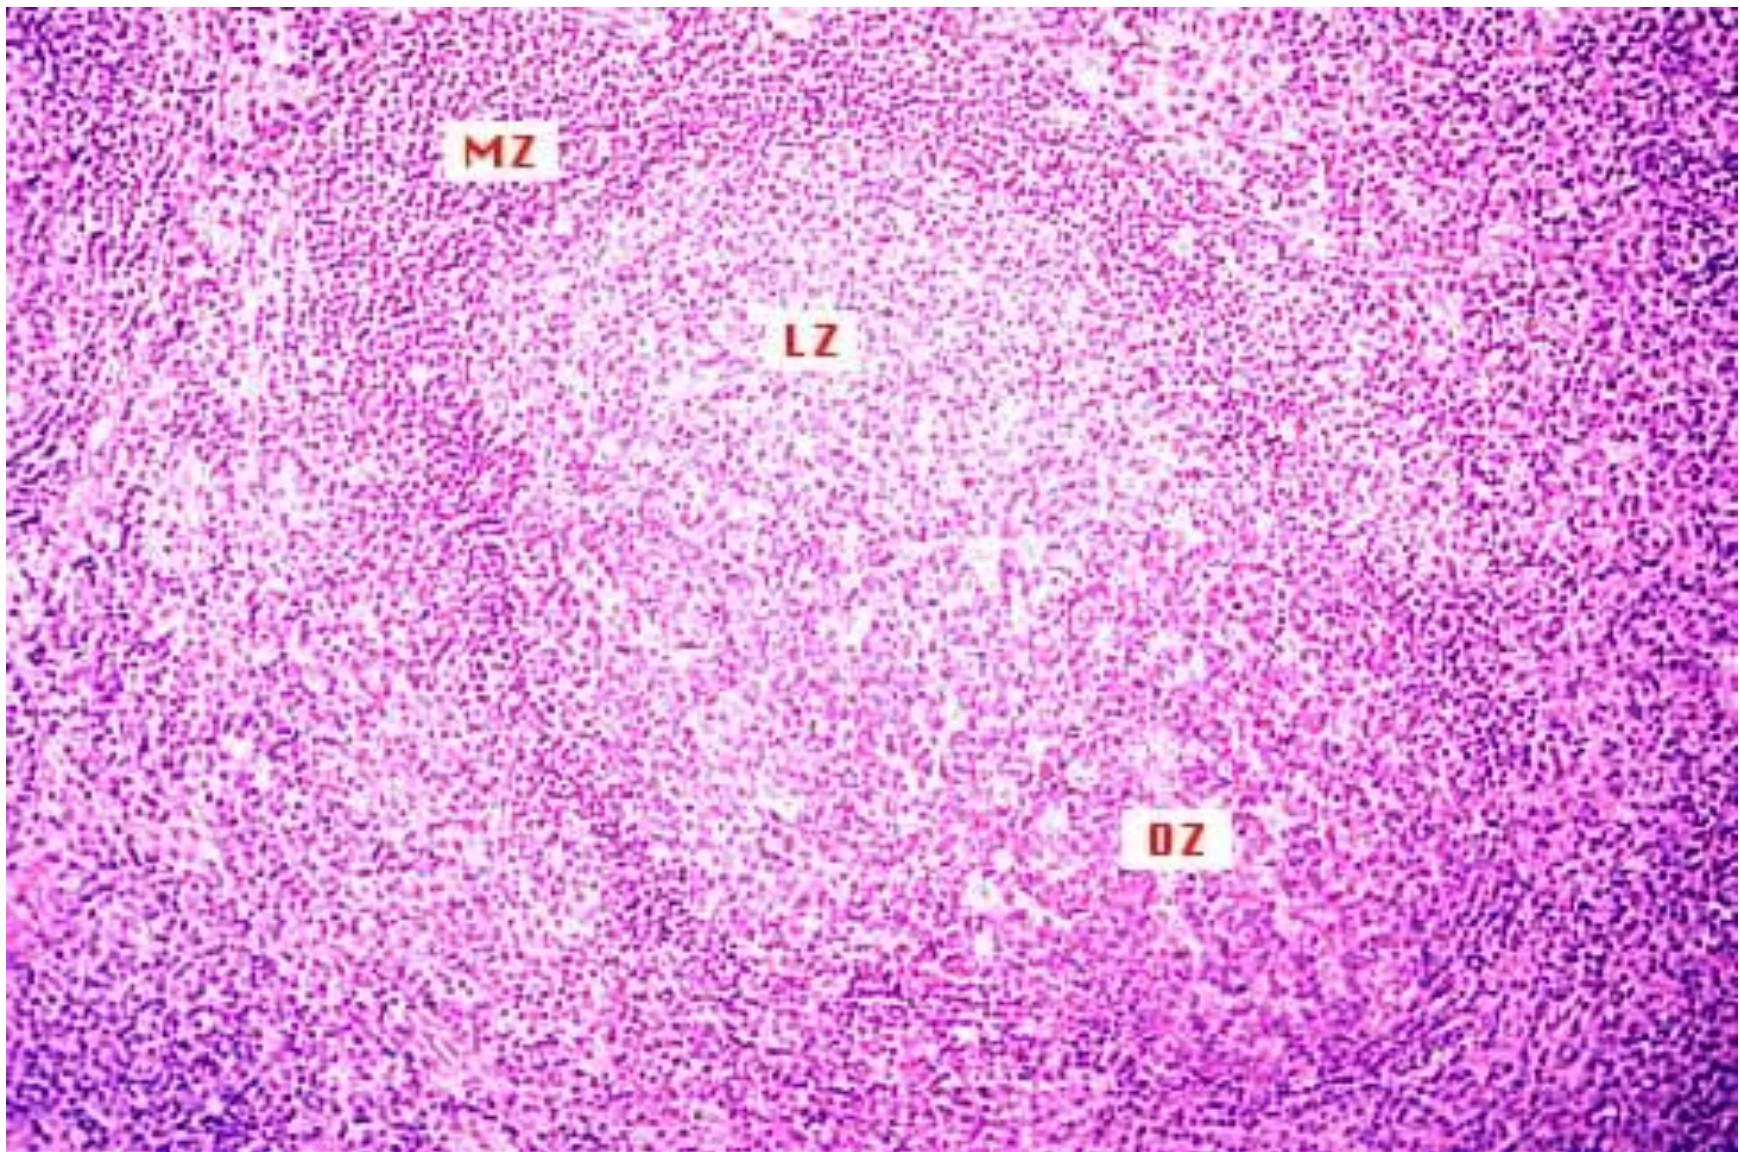

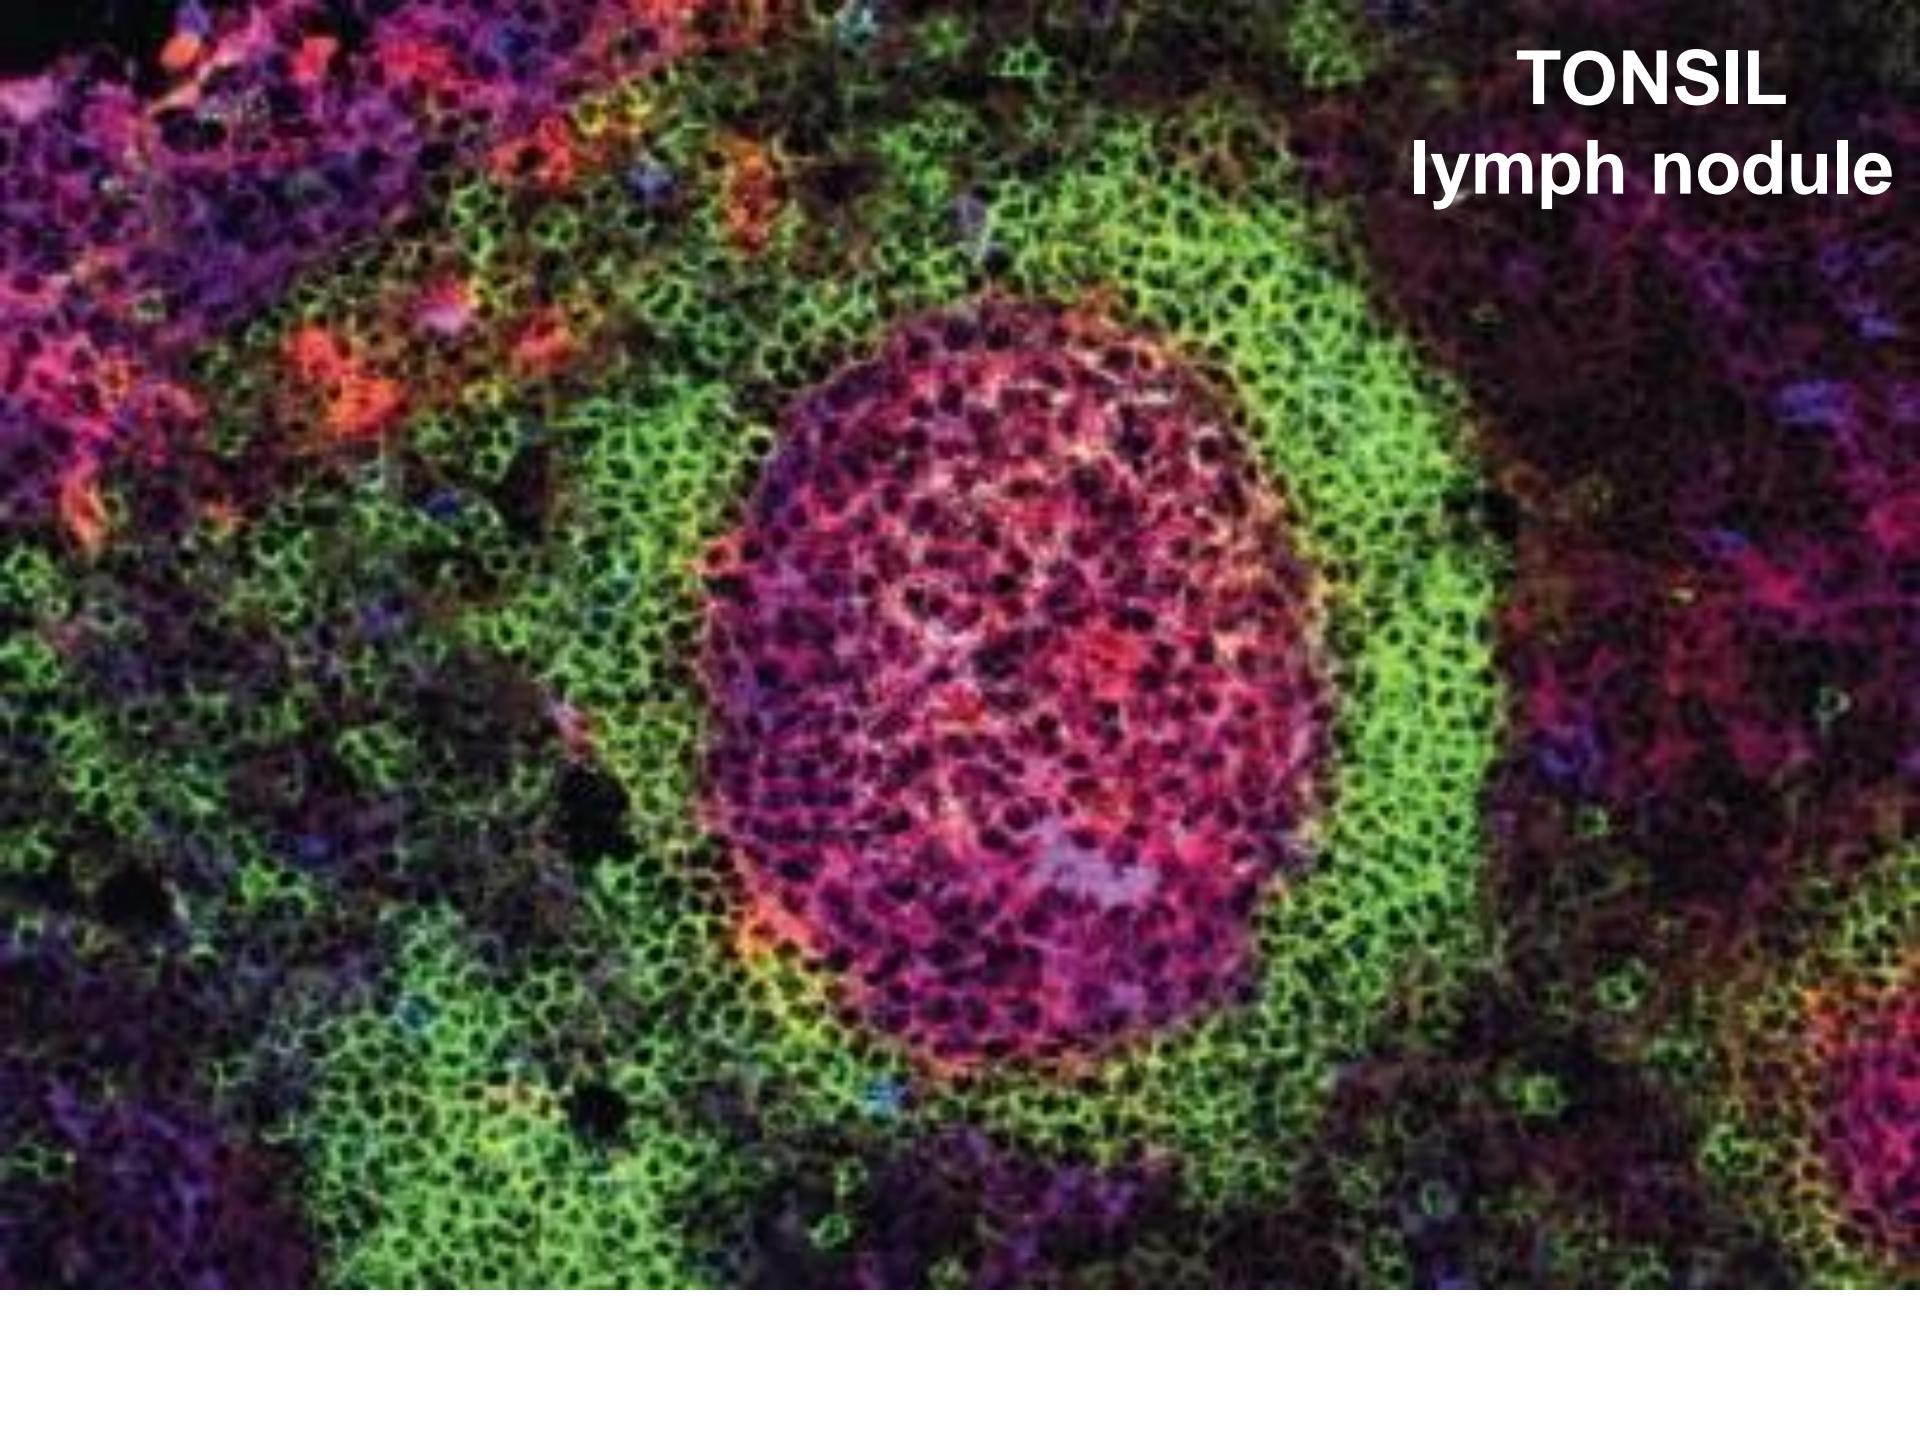

Lymph node – blood and lymph flow

- **vessels:** „naive“ lymphocytes from primary lymphoid organs
- **vasa lymphatica afferentia:** lymph with antigenes and antigen-presenting cells (APC) → sinus subcapsularis → sinus internodulares (radiate from capsule into medulla) → sinus lymphaticus medullaris → vas lymphaticum efferens
- **vas lymphaticum efferens:** mature effector cells

Lymph nodule – germinal center

A high-magnification light micrograph showing a cross-section of a tonsil. A prominent, circular lymphoid nodule is centered in the image, exhibiting a dense, pinkish-red core of densely packed lymphoid cells. This core is surrounded by a layer of smaller, green-stained cells, likely epithelial cells or plasma cells. The outermost layer consists of a dense arrangement of small, dark-staining nuclei, characteristic of the germinal center of a lymphoid nodule.

TONSIL
lymph nodule

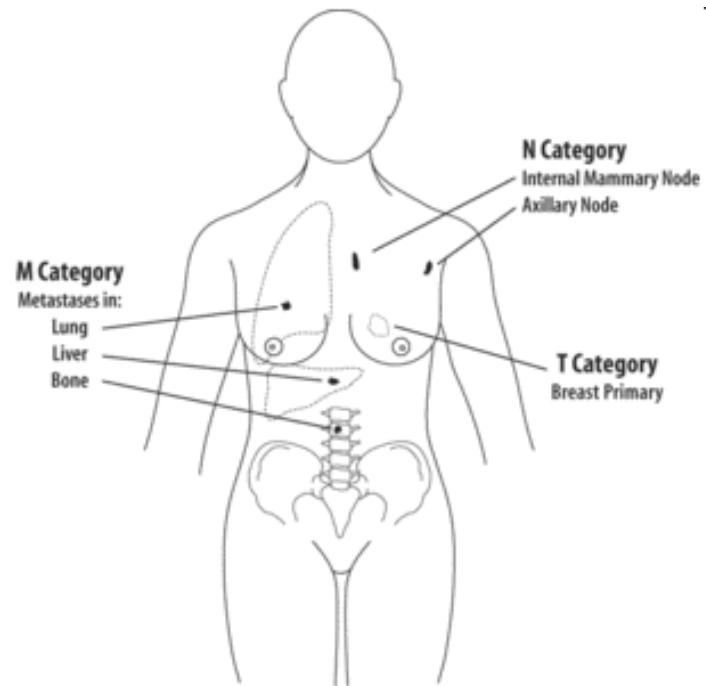

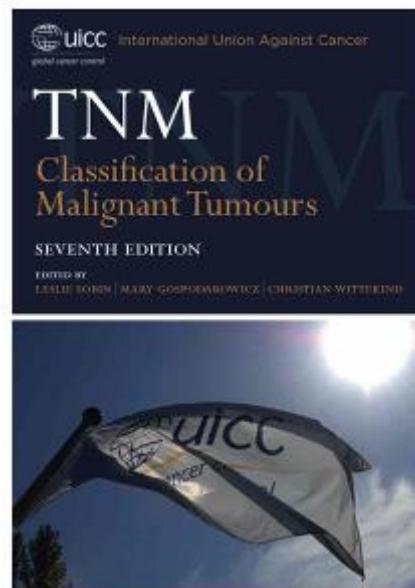

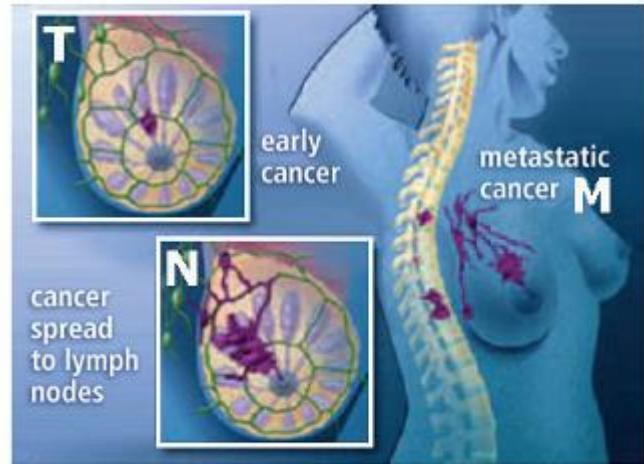

Lymph nodes – distribution

- tributary regions
 - regional lymph nodes
 - sentinel lymph node
-
- *inflammation – painful swelling*
 - *tumour – unpainful swelling*
 - *lymphedema (elephantiasis)*

TNM classification

TNM classification

- tumor
- nodus
- metastasis
 - contact (direct spreading)
 - *lymphogenous*
 - *haematogenous*

T1

T1 Clinically inapparent; tumor not palpable or visible by imaging

T1a Incidental finding during transurethral resection of prostate; < 5% of tissue resected

T1b Incidental finding during transurethral resection of prostate; > 5% of tissue resected

T1c Tumor identified by needle biopsy (e.g. because of elevated PSA)

T2

T2 Tumor confined within prostate (palpable or visible on TRUS)

T2a Involves half of a lobe or less

T2b Involves more than half of a lobe one lobe but not both lobes

T2c Tumor involves both lobes

T3

T3 Tumor extends through prostatic capsule, bladder neck or seminal capsule

T3a Unilateral extracapsular extension

T3b Bilateral extracapsular extension

T3c Tumor invades seminal vesicle(s)

T4

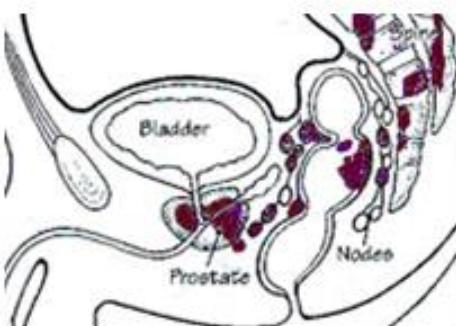

T4 The tumor has spread or attached to tissues next to the prostate (other than the seminal vesicles).

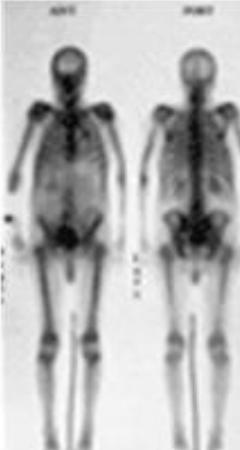

T4a The tumor has spread to the neck of the bladder, the external sphincter (muscles that help control urination), or the rectum.

T4b The tumor has spread to the floor and/or the wall of the pelvis.

N0-3

M0-1

N0 Cancer has not spread to any lymph nodes.

N1 Cancer has spread to a single regional lymph node (inside the pelvis) and is not larger than 2 centimeters

N2 Cancer has spread to one or more regional lymph nodes and is larger than 2 centimeters ($\frac{3}{4}$ inch), but not larger than 5 centimeters

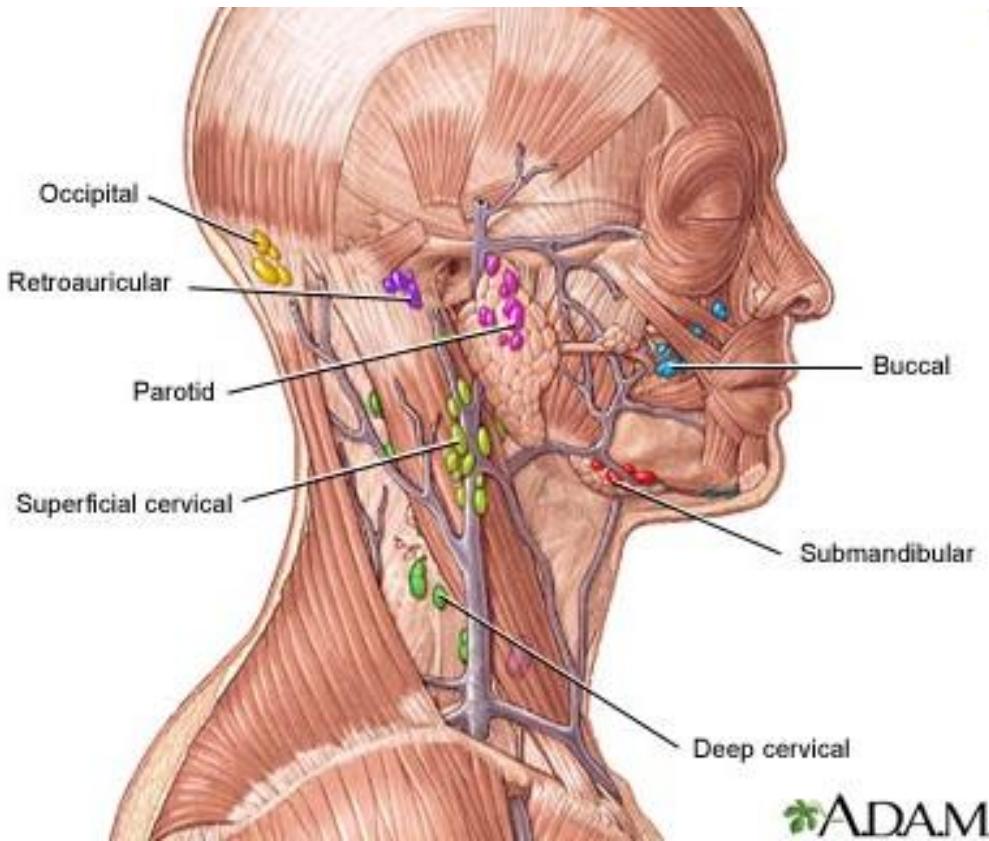

N3: Cancer has spread to a lymph node and is larger than 5 centimeters

M0: The cancer has not metastasized (spread) beyond the regional lymph nodes

M1: The cancer has metastasized to distant lymph nodes (outside of the pelvis), bones, or other distant organs such as lungs, liver, or brain

Head

- n.l. occipitales
 - *rubella*
 - *toxoplasmosis*
- n.l. mastoidei
- n.l. parotidei
- n.l. faciales

Neck

n.l. cervicales

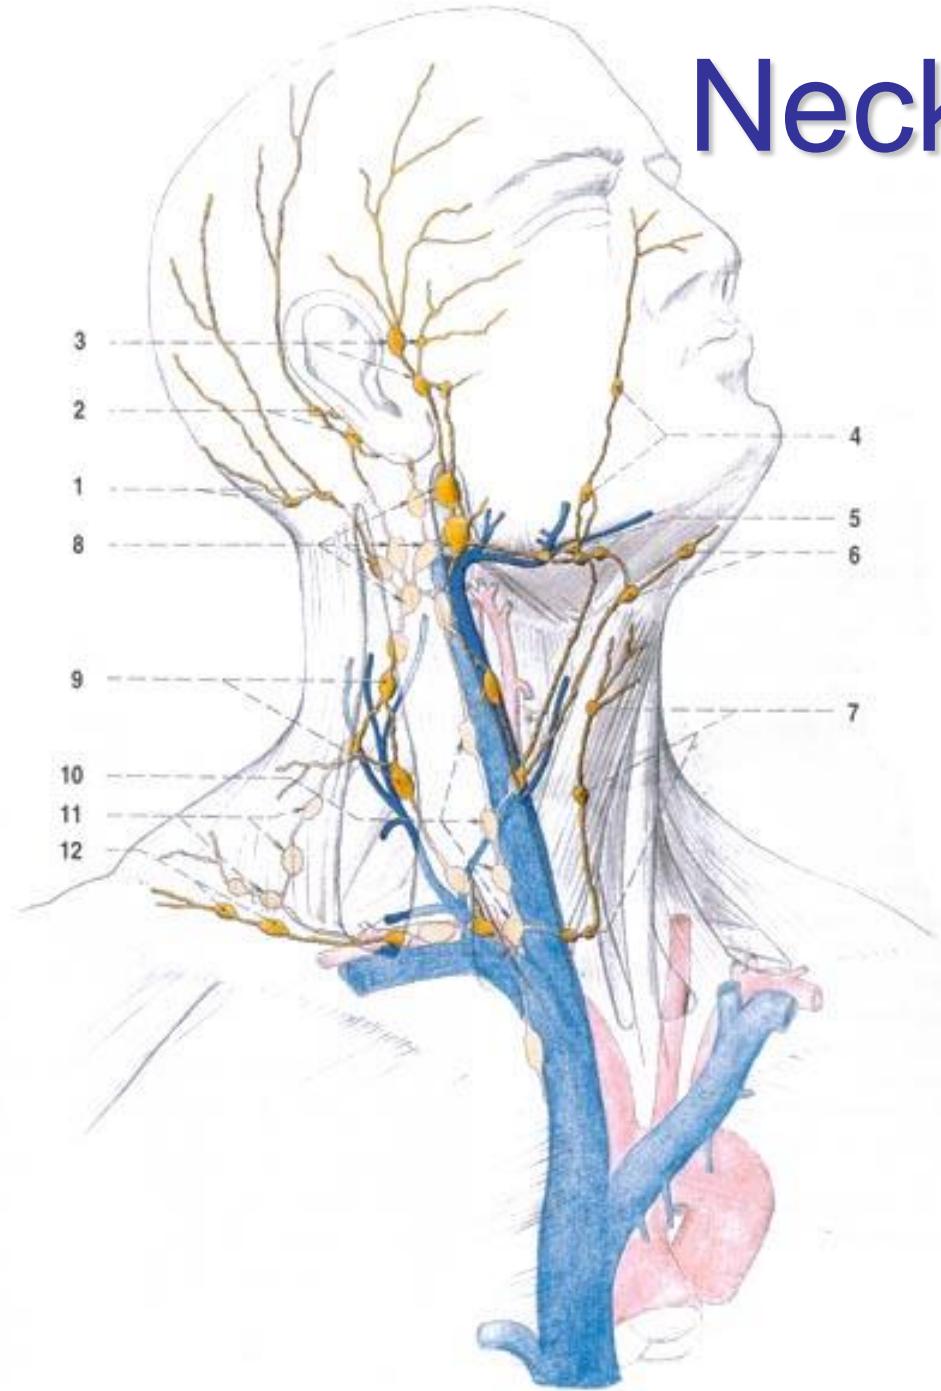

- anteriores
- laterales

n.l.c. profundi

- n.l. jugulodigastricus
- n.l. juguloomohyoideus

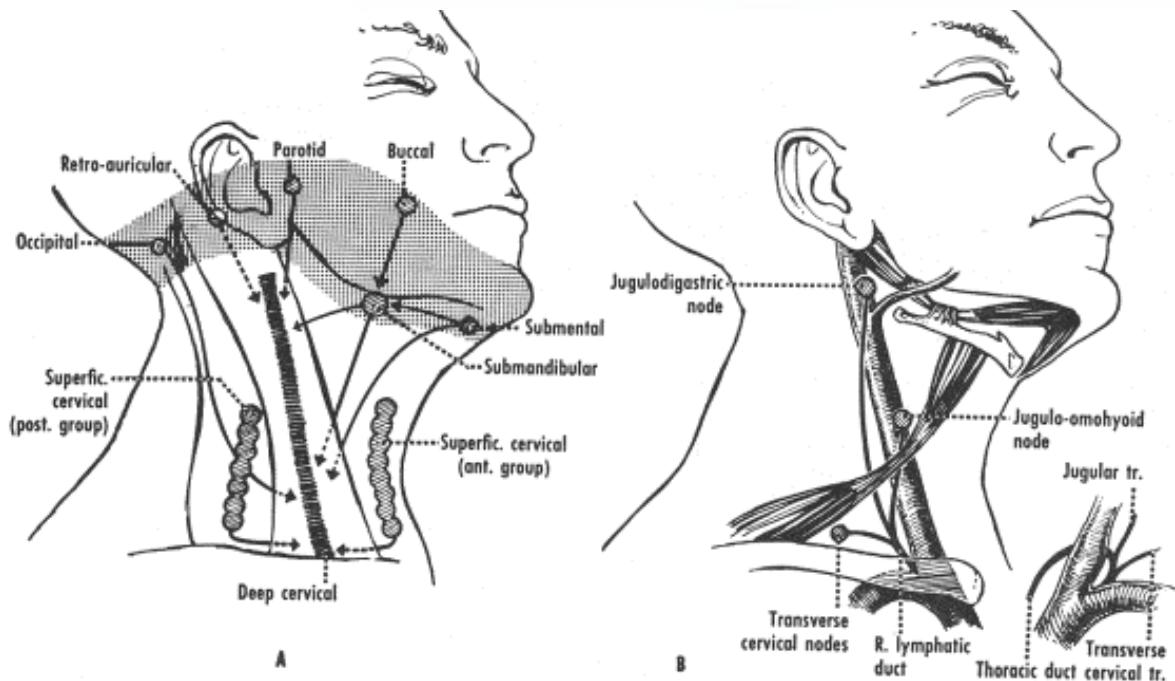

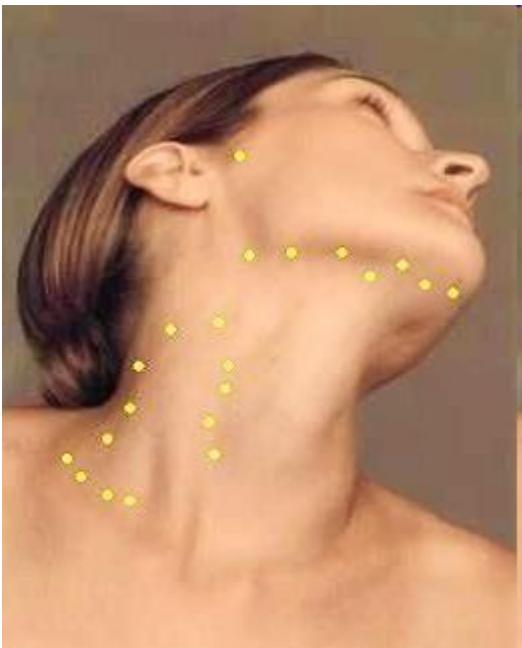

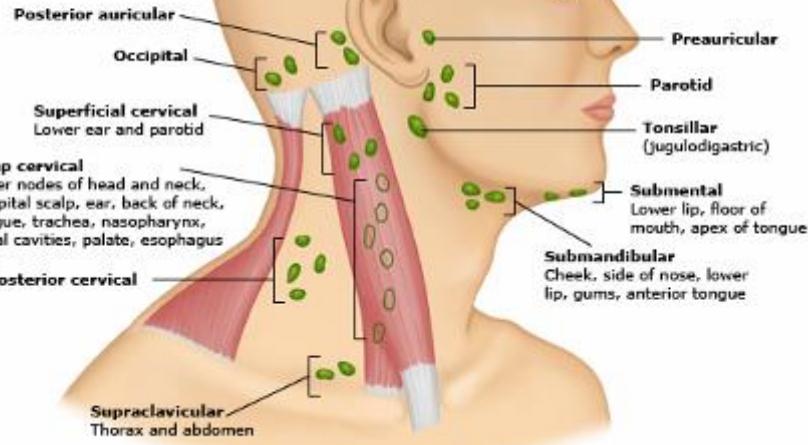

n.l.c. superficiales

- chain along v. jugularis int. (= n.l. cervicales laterales profundi)
- chain along n. XI (n.l. accessorii)
- n.l. supraclaviculars

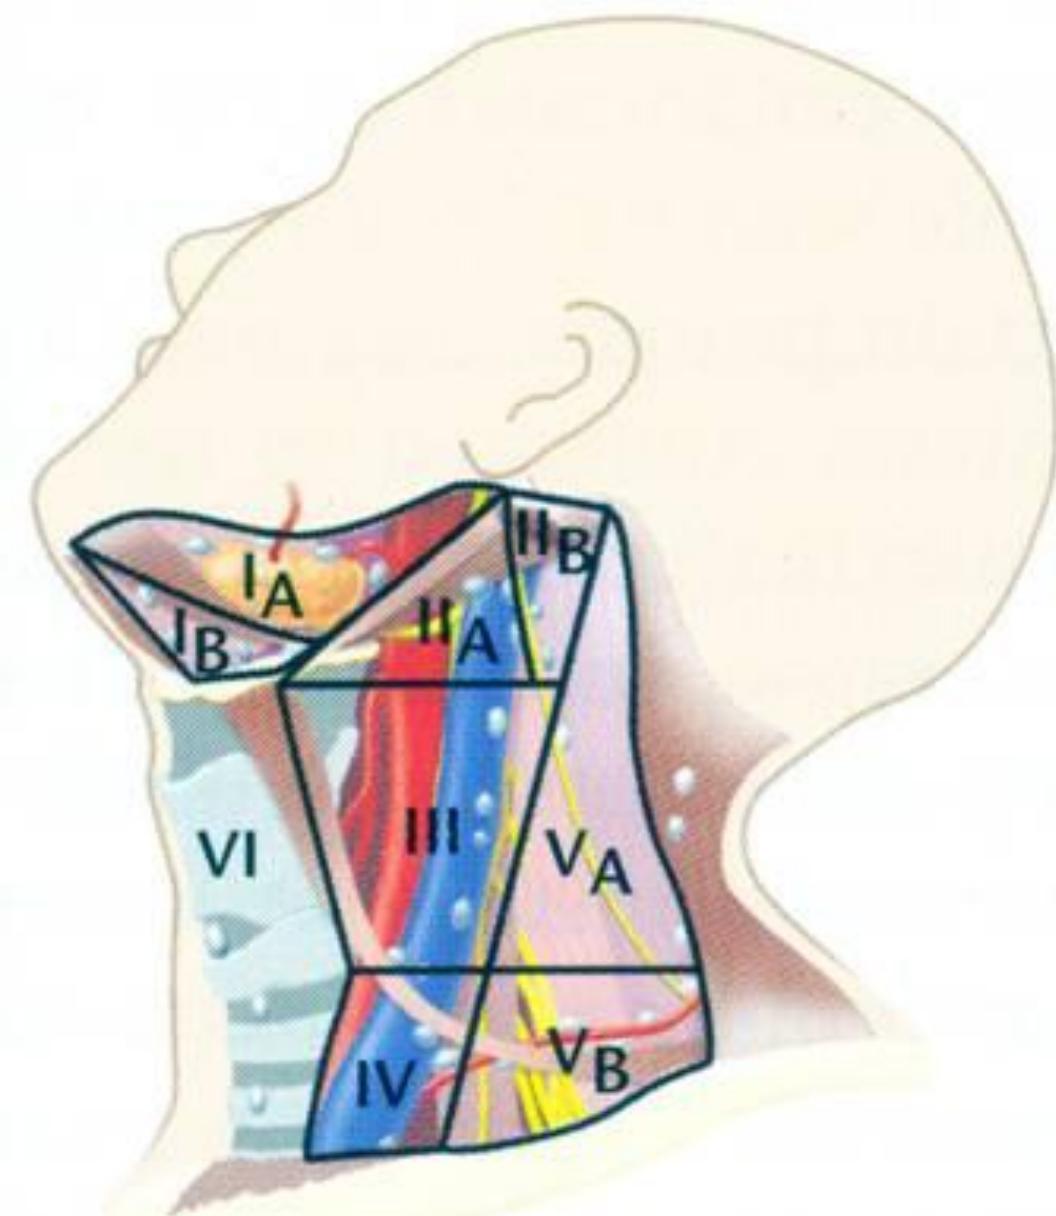

- n.l. submentales
- n.l. submandibulares
- n.l. pretracheales
- n.l. paratracheales
- n.l. retropharyngei
 - **Rouvière's node**
 - childern, mesotitis

Neck

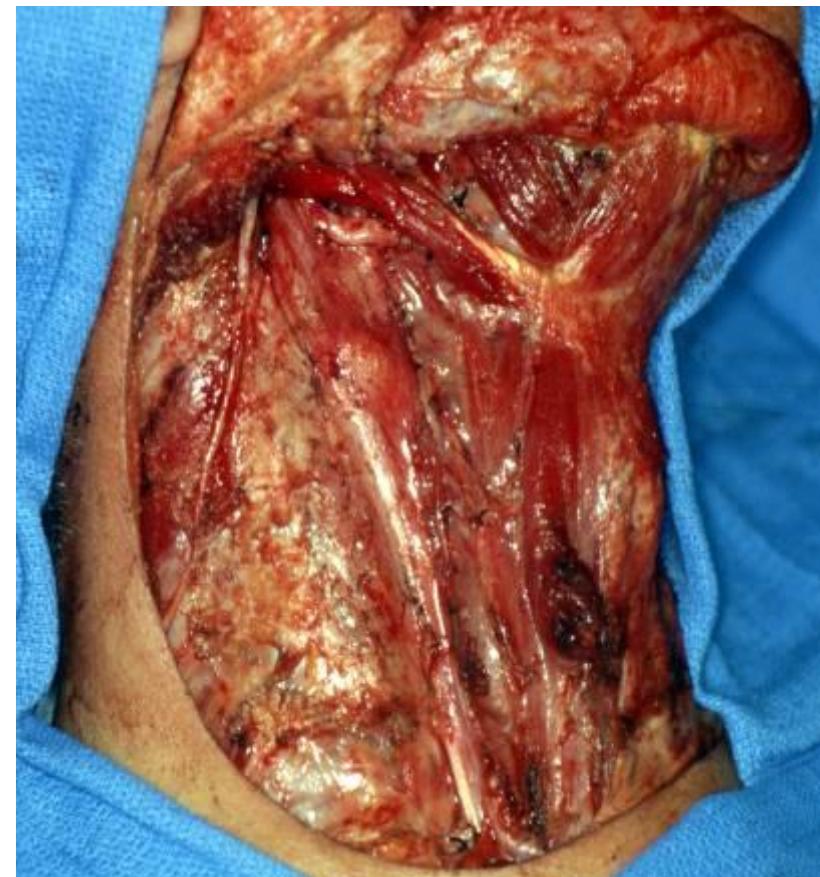

Clinical classification of cervical lymph nodes

6 quadrants

Robbins, 2001

6 levels (quadrants) of cervical lymph nodes

Ia: lower lip, mouth, anterior 1/3 of the tongue, anterior 1/3 of the mandibular alveolar ridge

Ib: mouth, nasal cavities, skin and soft tissues of the ipsilateral midface

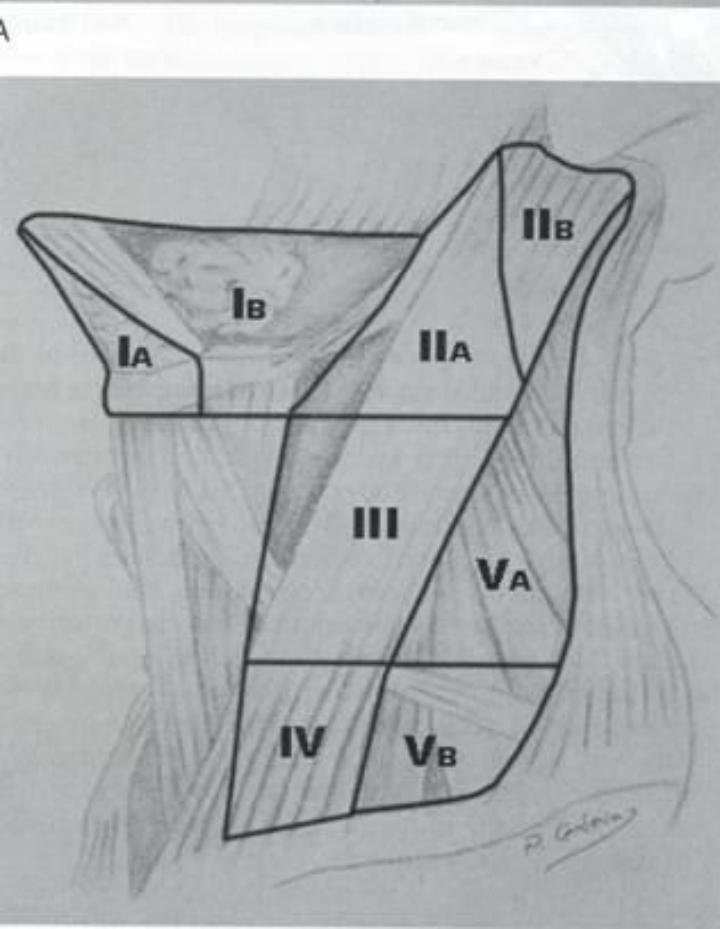

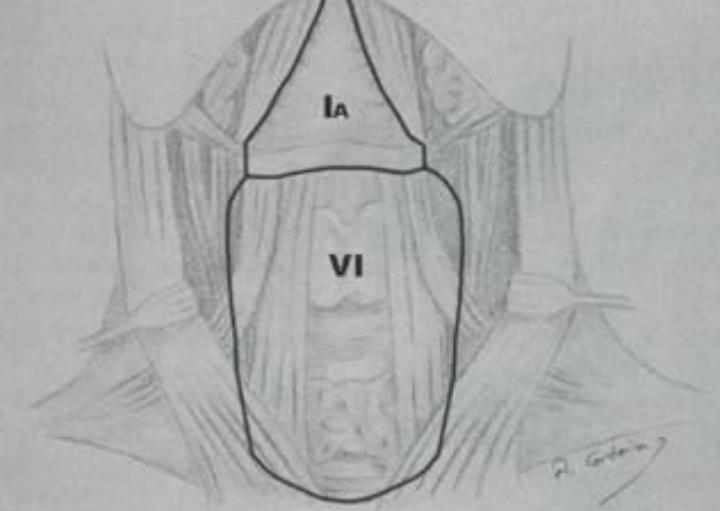

II: mouth, nasal cavities, nasopharynx, oropharynx, hypopharynx, larynx, parotid glands

III: mouth, nasopharynx, oropharynx, hypopharynx, larynx

IV: hypopharynx, larynx, cervical oesophagus

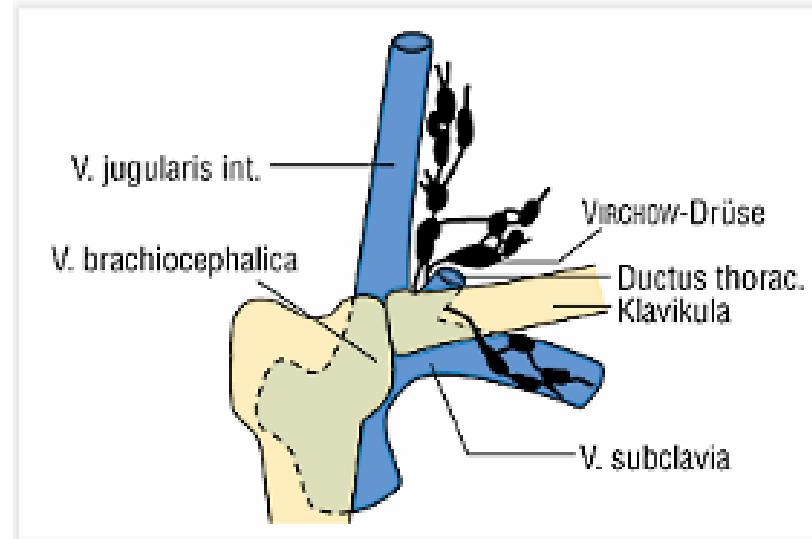

V: nasopharynx + oropharynx

VI: thyroid gland, larynx, cervical oesophagus

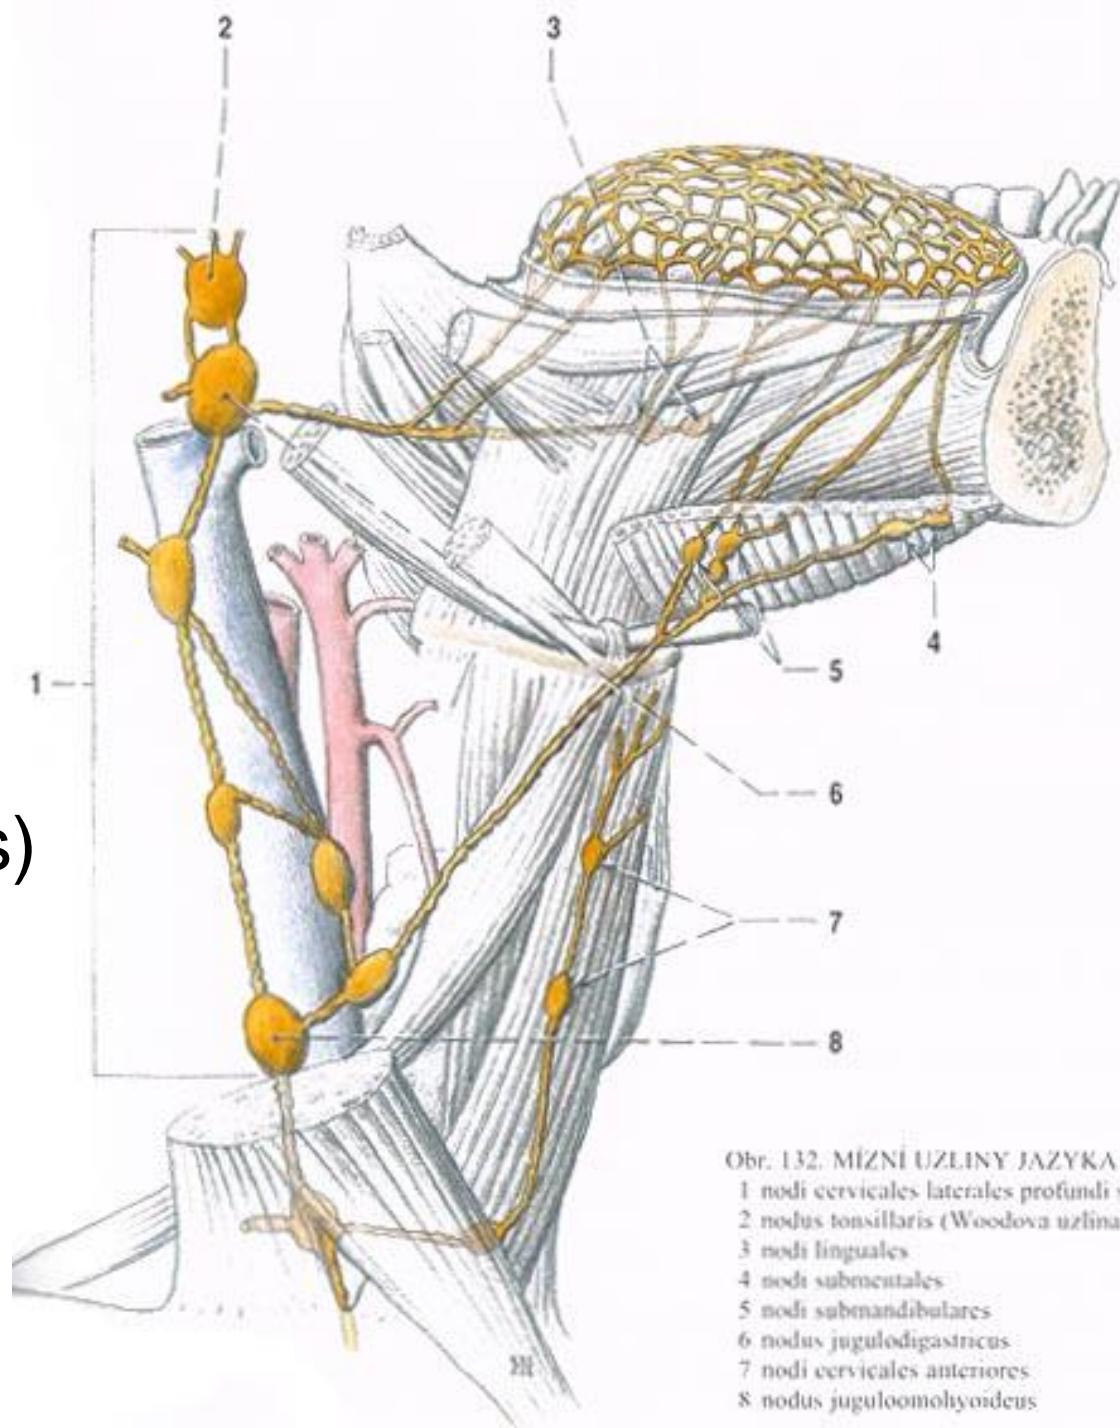

Virchow-Troisier

- n.l. supraclavicularis sinistri
- enlarged in:
 - tumor of stomach (70%)
 - tumor of left breast
 - tumor of lung
 - tumor of large intestine
 - tumor of neck on the left
 - primary lymphoma

Tongue

- 4 directions
- n.l. submentales
(apex)
- n.l.
submandibulares
(corpus: margines)
- n.l. cervicales
profundi (corpus:
center + radix)
- contralaterally
across midline

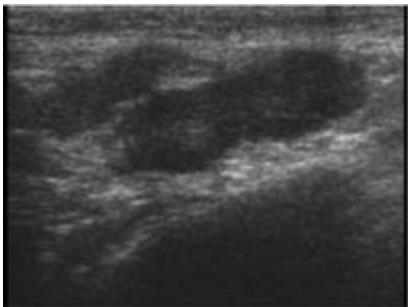

Axilla

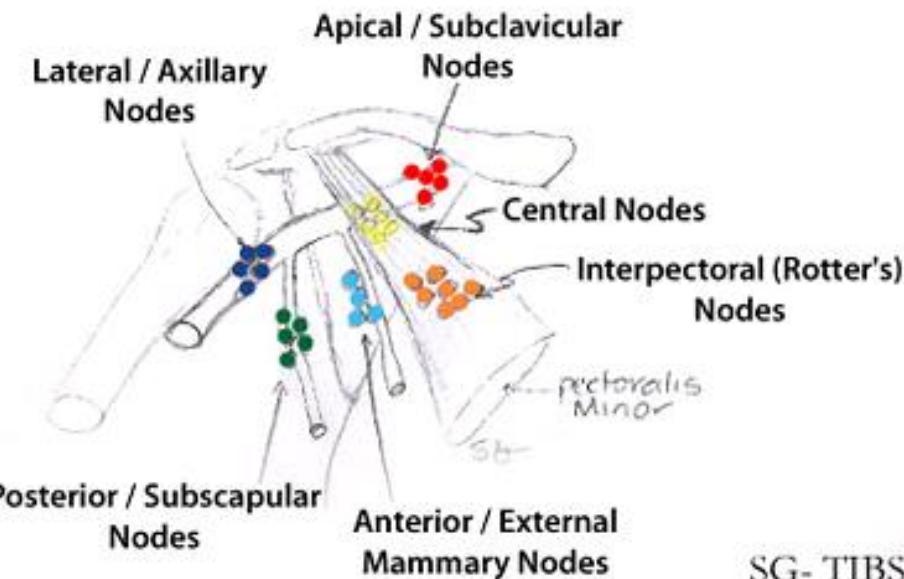

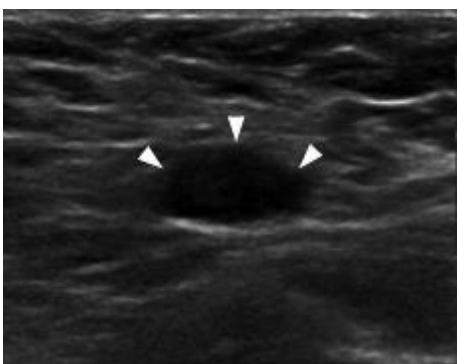

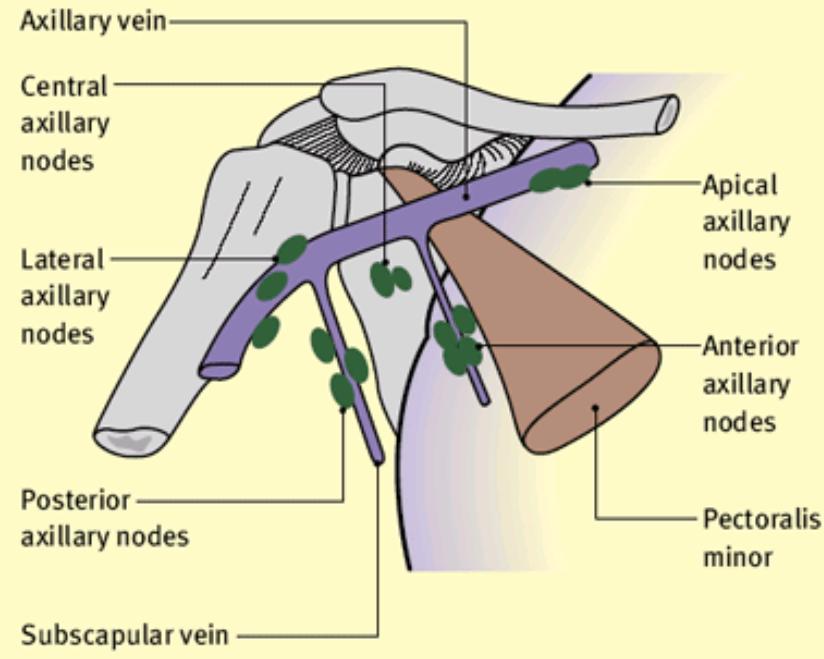

up to 40

5 groups

- apicales
- centrales
- humerales
- subscapulares
- pectorales

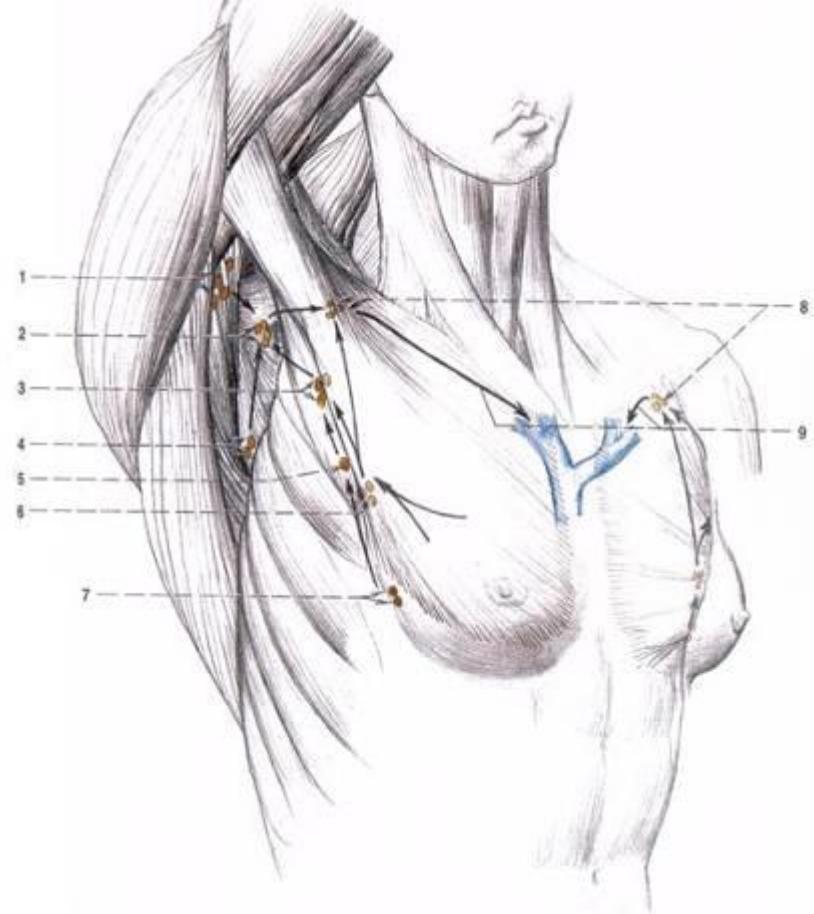

Lymph nodes of the axilla

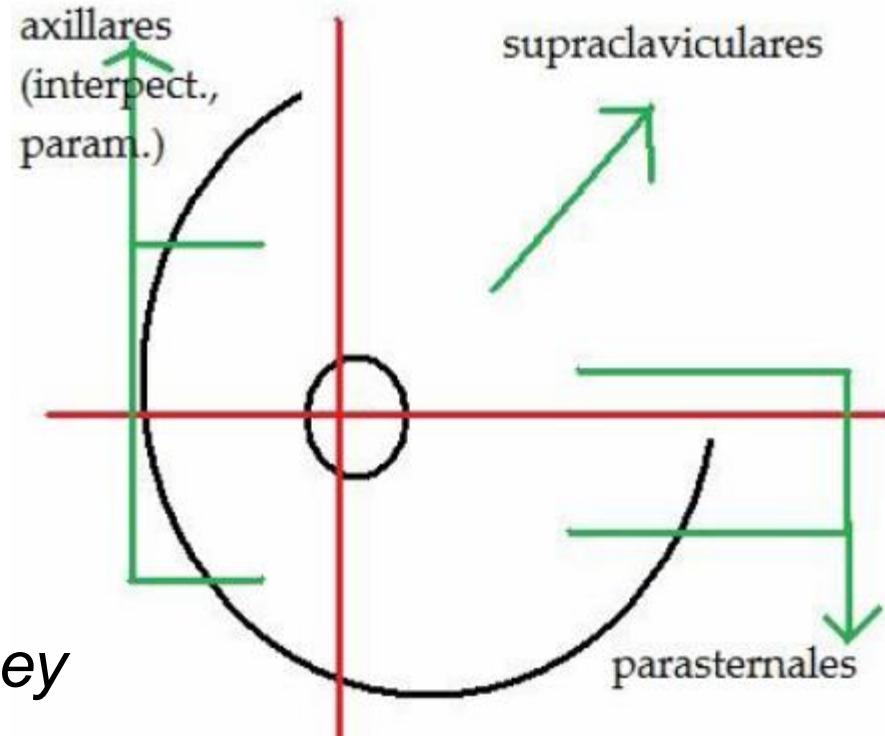

Mammary gland

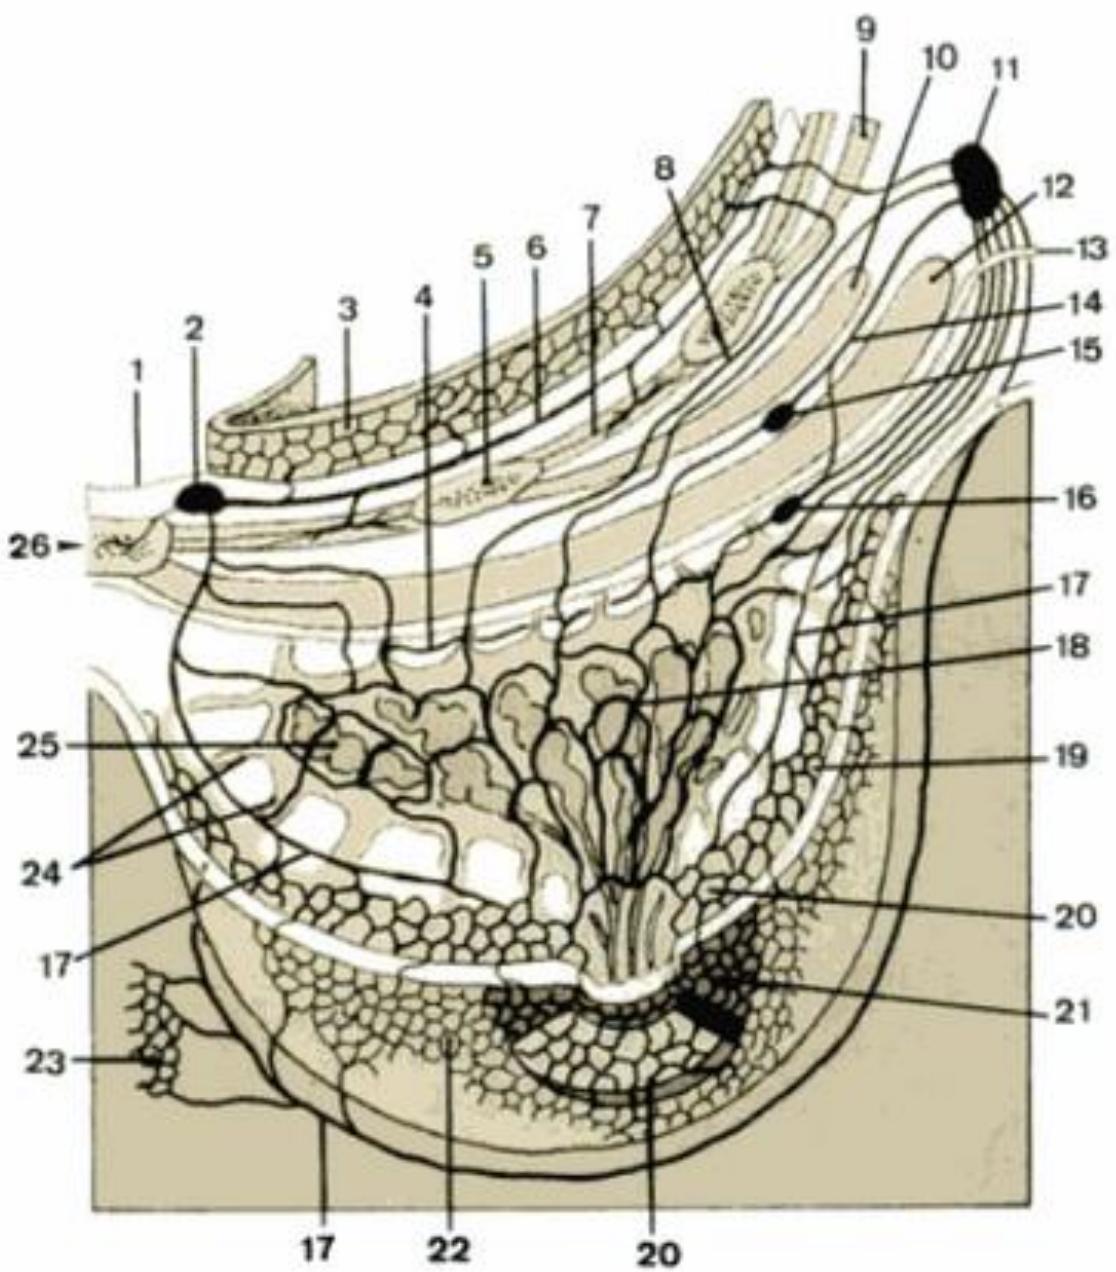

- **n.l. pectoralis *Sorgius***
 - 2nd/3th tooth of m. serratus anterior
 - *sentinel lymph node*
- n.l. infraclaviculares → supraclaviculares
- n.l. parasternales → n.l. mediastinales ant.
- across midline → n.l. axillares contralaterales

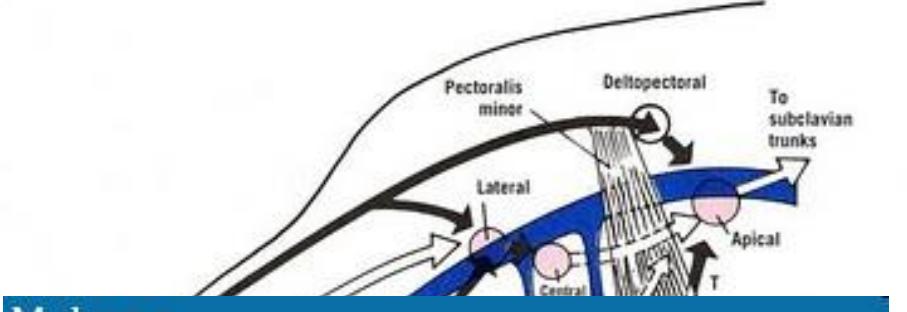

Mammary gland

- 4 quadrants
- 2 superficial plexuses:
 - plexus dermalis
 - plexus subareolaris *Sappey*
 - drainage into n.l. axillares
- 2 deep plexuses:
 - plexus fascialis
 - plexus glandularis
 - drainage into superficial plexuses and other lymph nodes
- 80% of lymph into n.l. axillares

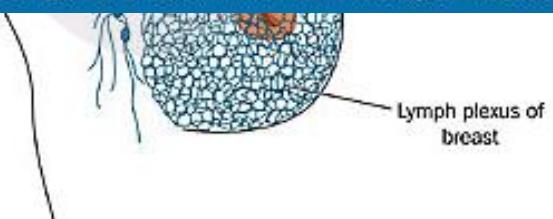

Medscape

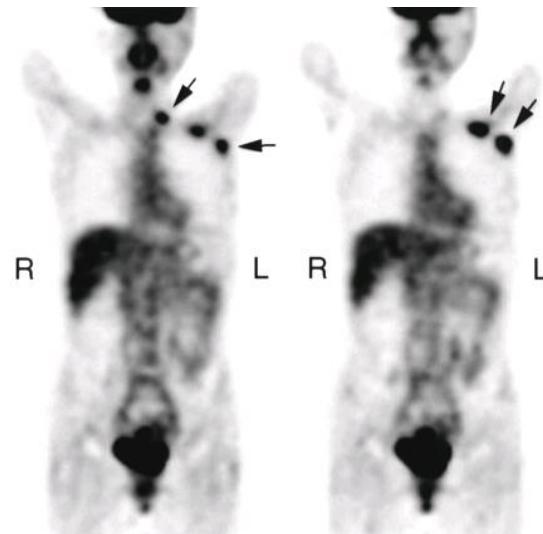

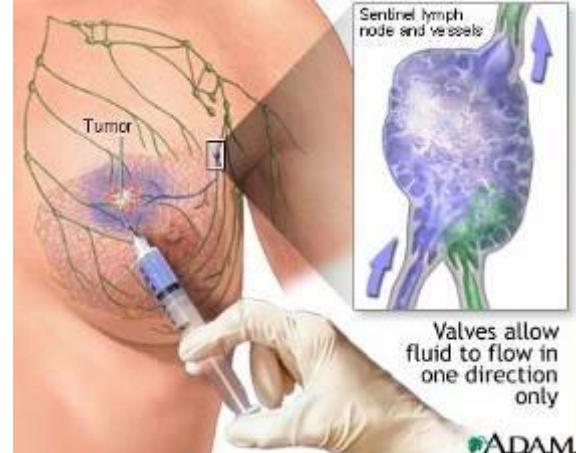

Source: Am J Roentgenol © 2009 American Roentgen Ray Society

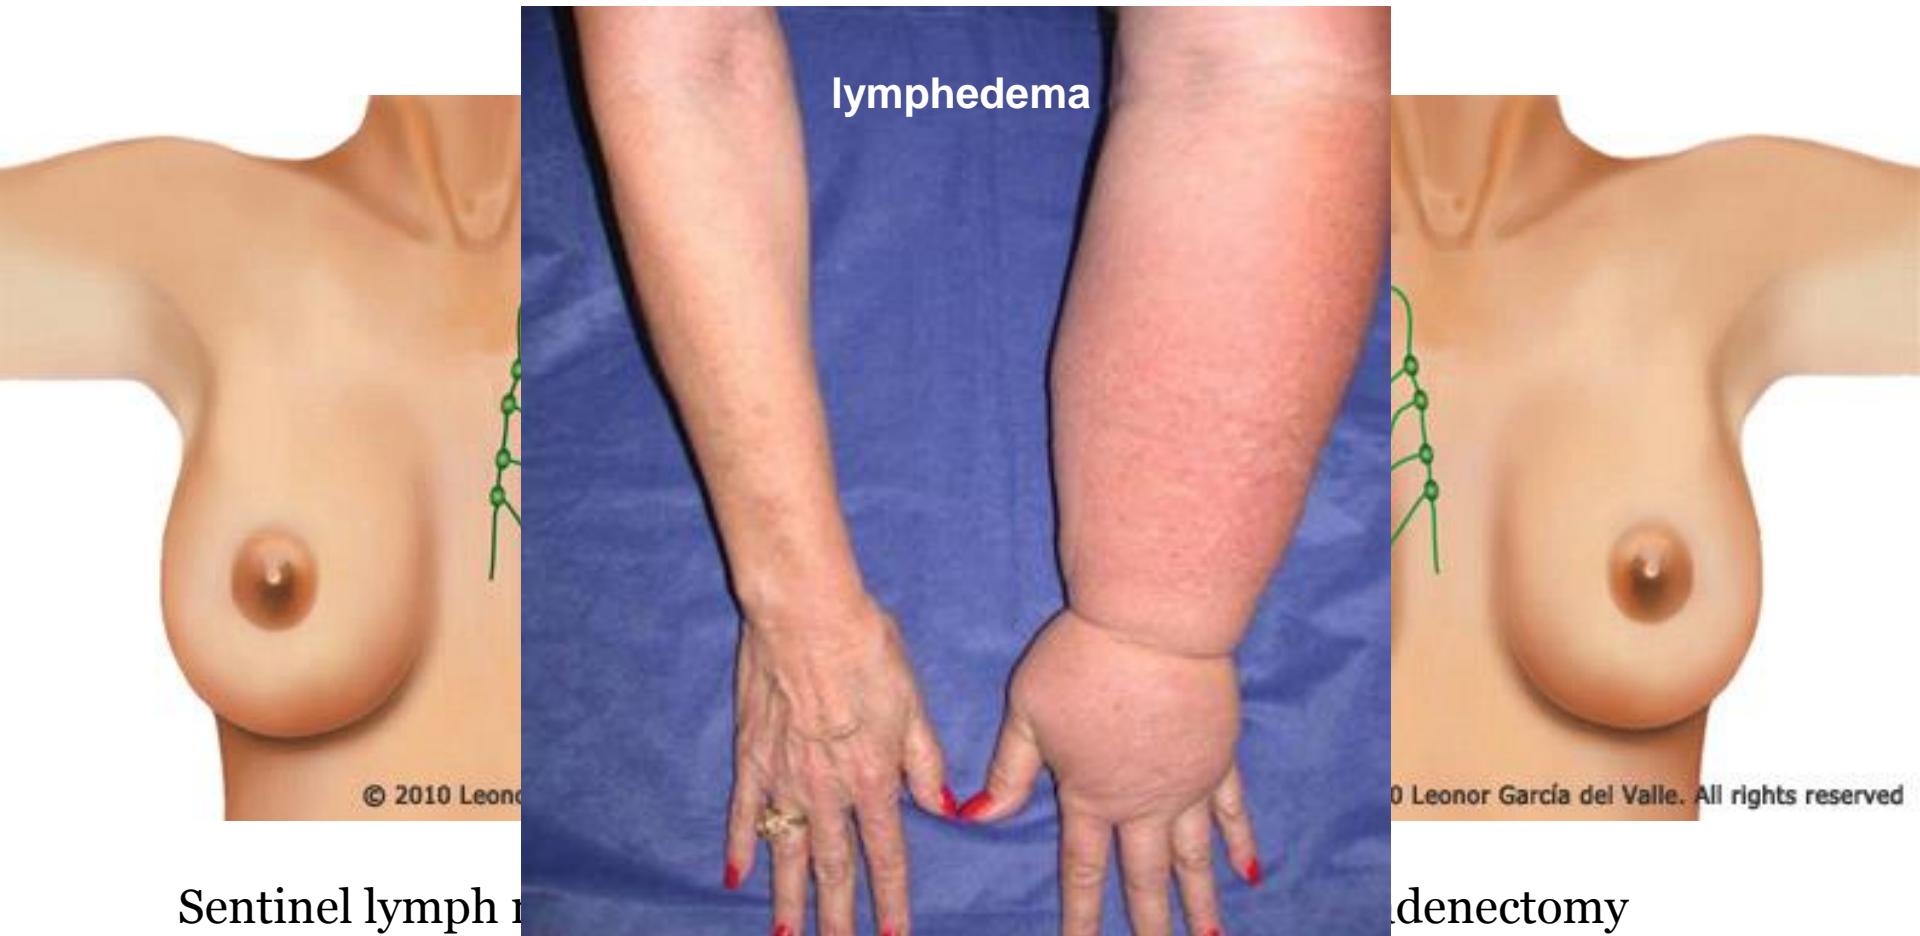

Axillary nodes – clinical relevance

- sentinel lymph node visualization
 - staining: application of 10 ml of blue stain (Patentblau, Evans blue) into tumour → after 10 minutes incision in axilla and dissection of sentinel lymph node → following coloured lymph vessels to coloured lymph node → aspectation of vicinity (more coloured nodes)
 - radioactivity: injection of 60 MBq (0,2 ml) Tc-99m-nanocolloid → probe seeking after 2 hours (*lymphoscintigraphy*)

Axillary lymphadenectomy axilla exenteration

3 levels according to Berg

1. below m. pectoralis minor

- n.l. pectorales (ant.)
- n.l. subcapulares (post.)
- n.l. humerales (lat.)

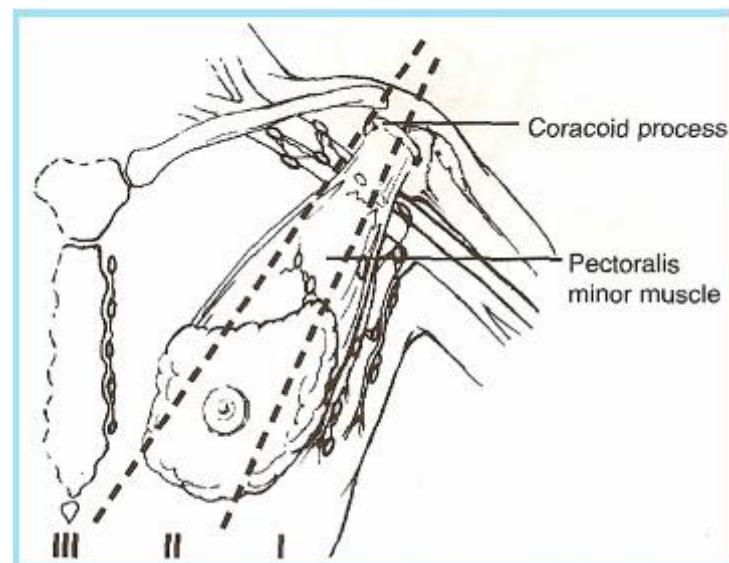

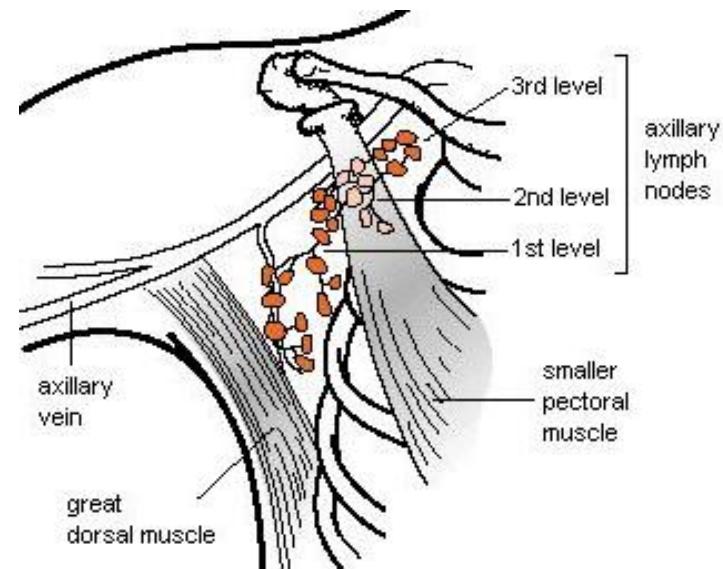

2. behind m. pectoralis minor

- n.l. centrales, apicales (part)
- n.l. interpectorales (*Rotter*)

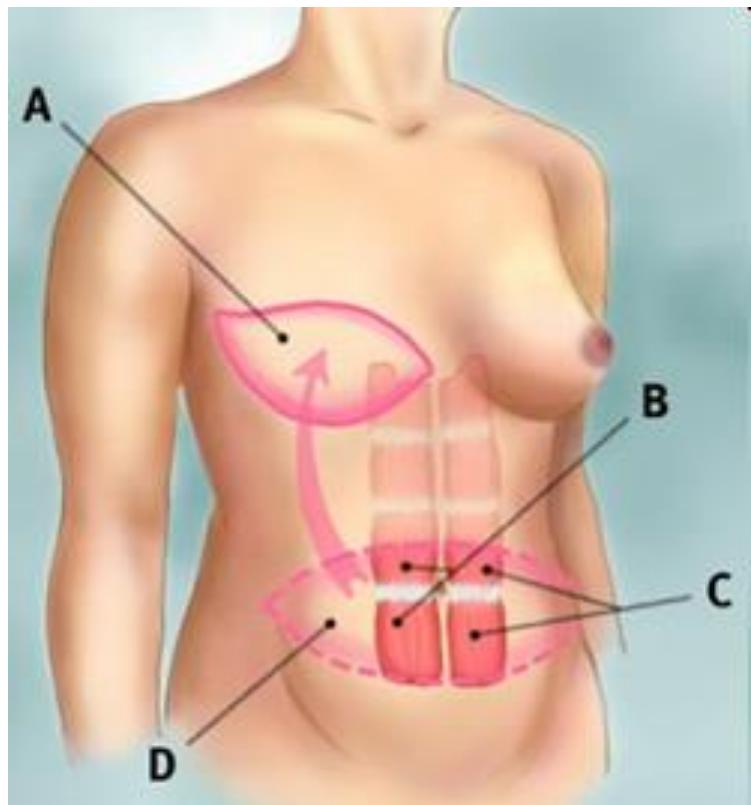

3. behind nerves and vessels

- n.l. apicales

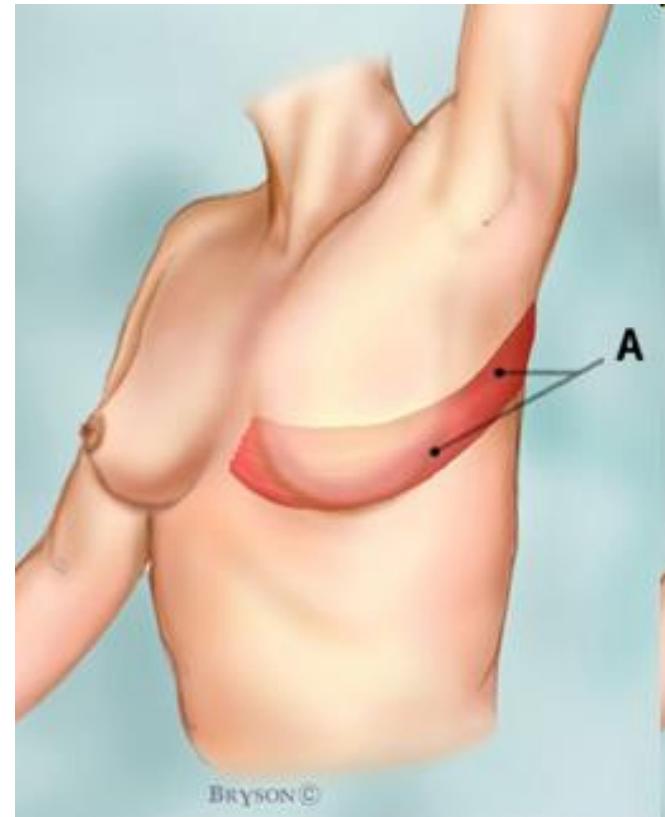

complete dissection of axillary lymph nodes of 1st and 2nd level = axilla exenteration
(danger of elephantiasis!)

Trans-rectus abdominis muscle (TRAM)

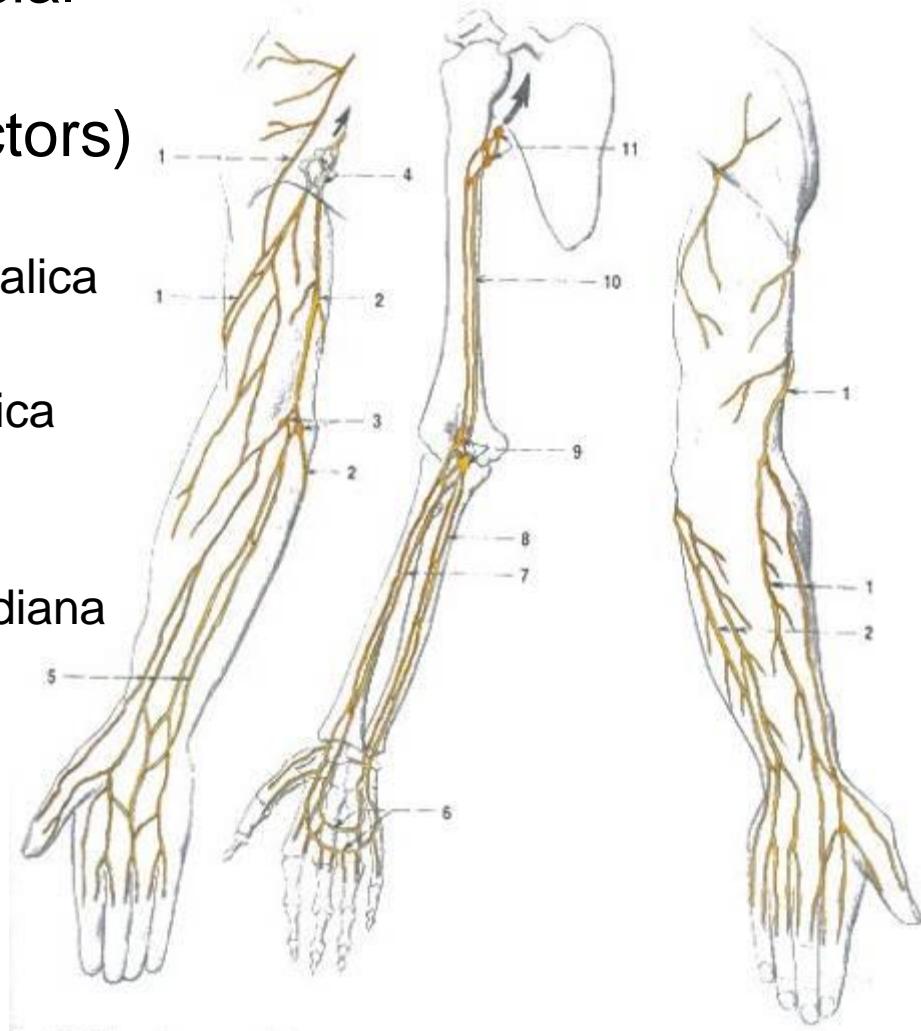

Latissimus dorsi muscle
